# Chapter 1

## GNU Unifont

### 1.1 GNU Unifont C Utilities

This documentation covers C utility programs for creating GNU Unifont glyphs and fonts.

### 1.2 LICENSE

This program is free software: you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation, either version 2 of the License, or (at your option) any later version.

This program is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.

You should have received a copy of the GNU General Public License along with this program. If not, see <http://www.gnu.org/licenses/>.

### 1.3 Introduction

Unifont is the creation of Roman Czyborra, who created Perl utilities for generating a dual-width Bitmap Distribution Format (BDF) font 16 pixels tall, `unifont.bdf`, from an input file named `unifont.hex`. The `unifont.hex` file contained two fields separated by a colon: a Unicode code point as four hexadecimal digits, and a hexadecimal string of 32 or 64 characters representing the glyph bitmap pattern. Roman also wrote other Perl scripts for manipulating `unifont.hex` files.

Jungshik Shin wrote a Perl script, `johab2ucs2`, to convert Hangul syllable glyph elements into Hangul Johab-encoded fonts. These glyph elements are compatible with Jaekyung "Jake" Song's Hanterm terminal emulator. Paul Hardy modified `johab2ucs2` and drew Hangul Syllables Unicode elements for compatibility with this Johab encoding and with Hanterm. These new glyphs were created to avoid licensing issues with the Hangul Syllables glyphs that were in the original `unifont.hex` file.

Over time, Unifont was extended to allow correct positioning of combining marks in a TrueType font, coverage beyond Unicode Plane 0, and the addition of Under-ConScript Unicode Registry (UCSUR) glyphs. There is also partial support for experimental quadruple-width glyphs.

Paul Hardy wrote the first pair of C programs, [unihex2bmp.c](#) and [unibmp2hex.c](#), to facilitate editing the bitmaps at their real aspect ratio. These programs allow conversion between the Unifont .hex format and a Windows Bitmap or Wireless Bitmap file for editing with a graphics editor. This was followed by make files, other C programs, Perl scripts, and shell scripts.

Luis Alejandro González Miranda wrote scripts for converting unifont.hex into a TrueType font using FontForge.

Andrew Miller wrote additional Perl programs for directly rendering unifont.hex files, for converting unifont.hex to and from Portable Network Graphics (PNG) files for editing based upon Paul Hardy's BMP conversion programs, and also wrote other Perl scripts.

David Corbett wrote a Perl script to rotate glyphs in a unifont.hex file and an awk script to substitute new glyphs for old glyphs of the same Unicode code point in a unifont.hex file.

何志翔 (He Zhixiang) wrote a program to convert Unifont files into OpenType fonts, [hex2otf.c](#).

Minseo Lee created new Hangul glyphs for the original Unifont Johab 10/3 or 4/4 encoding. This was followed immediately after by Ho-Seok Ee, who created Hangul glyphs for a new, simpler Johab 6/3/1 encoding that are now in Unifont.

## 1.4 The C Programs

This documentation only covers C programs and their header files. These programs are typically longer than the Unifont package's Perl scripts, which being much smaller are easier to understand. The C programs are, in alphabetical order:

Program	Description
<a href="#">hex2otf.c</a>	Convert a GNU Unifont .hex file to an OpenType font
<a href="#">johab2syl</a>	Generate Hangul Syllables range with simple
	positioning

Program	Description
<a href="#">unibdf2hex</a>	Convert a BDF file into a uni-font.hex file
<a href="#">unibmp2t1fn</a>	Turn a .bmp or .wbmp glyph matrix into a GNU Uni-font hex glyph set of 256 characters
<a href="#">unibmp2png</a>	Adjust a Microsoft bitmap (.bmp) file that was created by uni-hex2png but converted to .bmp

Program	Description
<a href="#">unicoverage</a>	Show the coverage of Unicode plane scripts for a GNU Unifont hex glyph file
<a href="#">unidup.c</a>	Check for duplicate code points in sorted unifont.hex file
<a href="#">unifont1p</a>	Read a Unifont .hex file from standard input and produce one glyph per .bmp bitmap file as output

Program	Description
<a href="#">unifontpi</a>	See the "Big Picture": the entire Unifont in one BMP bitmap
<a href="#">unigen-ha</a>	Generate modern and ancient Hangul syllables with shifting of final consonants combined with diphthongs having two long vertical strokes on the right
<a href="#">unigencir</a>	Superimpose dashed combining circles on combining glyphs

Program	Description
<a href="#">unigenwidths</a>	IEEE 1003.1-2008 setup to calculate wchar_t string widths
<a href="#">unihex2bitmap</a>	Turn a GNU Unifont hex glyph page of 256 code points into a bitmap for editing
<a href="#">unihexgen</a>	Generate a series of glyphs containing hexadecimal code points

Program	Description
<a href="#">unihexpos</a>	Transpose Uni- font .hex glyph bitmaps to sim- plify send- ing to graph- ics dis- play con- troller chips that read bitmaps as a se- ries of columns 8 rows (one byte) high

Program	Description
<a href="#">unijohab2enc.c</a>	<p>a            hangul-            base.hex            file            and            pro-            duce            an            HTML            page            as            out-            put            show-            ing            jux-            tapo-            sition            and            over-            lap-            ping            of all            letter            com-            bina-            tions            in            mod-            ern            and            an-            cient            Hangul            sylla-            bles</p>
<a href="#">unipagecount.c</a>	<p>Count            the            num-            ber of            glyphs            de-            fined            in            each            page            of 256            code            points</p>

## 1.5 Perl Scripts

The very first program written for Unifont conversion was Roman Czyborra's hexdraw Perl script. That one script would convert a unifont.hex file into a text file with 16 lines per glyph (one for each glyph row) followed by a blank line after each glyph. That allowed editing unifont.hex glyphs with a text-based editor.

Combined with Roman's hex2bdf Perl script to convert a unifont.hex file into a BDF font, these two scripts formed a complete package for editing Unifont and generating the resulting BDF fonts.

There was no combining mark support initially, and the original unifont.hex file included combining circles with combining mark glyphs.

The list below gives a brief description of these and the other Perl scripts that are in the Unifont package src subdirectory.

Perl Script	Description
bdfimplode	Convert a BDF font into GNU Unifont .hex format
hex2bdf	Convert a GNU Unifont .hex file into a BDF font
hex2sfd	Convert a GNU Unifont .hex file into a Font-Forge .sfd format

Perl Script	Description
hexbraille	Algorithmically generate the Unicode Braille range (U+28xx)
hexdraw	Convert a GNU Unifont .hex file to and from an ASCII text file
hexkinya	Create the Private Use Area Kinya syllables
hexmerge	Merge two or more GNU Unifont .hex font files into one

Perl Script	Description
johab2ucs2	Convert a Johab BDF font into GNU Unifont Hangul Syllables
unifont-viewer	View a .hex font file with a graphical user interface
unifontch	Extract Hangul syllables that have no final consonant
unifontks	Extract Hangul syllables that comprise KS X 1001:1992

Perl Script	Description
unihex2png	GNU Unifont .hex file to Portable Network Graphics converter
unihexfill	Generate range of Unifont 4- or 6-digit hexadecimal glyphs
unihexrotate	Rotate Unifont hex glyphs in quarter turn increments
unipng2hex	Portable Network Graphics to GNU Unifont .hex file converter

# Chapter 2

## Data Structure Index

### 2.1 Data Structures

Here are the data structures with brief descriptions:

<a href="#">Buffer</a>	Generic data structure for a linked list of buffer elements . . . . .	17
<a href="#">Font</a>	Data structure to hold information for one font . . . . .	18
<a href="#">Glyph</a>	Data structure to hold data for one bitmap glyph . . . . .	20
<a href="#">NamePair</a>	Data structure for a font ID number and name character string . . . . .	22
<a href="#">Options</a>	Data structure to hold options for OpenType font output . . . . .	23
<a href="#">PARAMS</a>	. . . . .	25
<a href="#">Table</a>	Data structure for an OpenType table . . . . .	27
<a href="#">TableRecord</a>	Data structure for data associated with one OpenType table . . . . .	28

# Chapter 3

## File Index

### 3.1 File List

Here is a list of all documented files with brief descriptions:

<a href="#">src/hangul.h</a>	Define constants and function prototypes for using Hangul glyphs . . . . .	31
<a href="#">src/hex2otf.c</a>	Hex2otf - Convert GNU Unifont .hex file to OpenType font . . . . .	76
<a href="#">src/hex2otf.h</a>	<a href="#">Hex2otf.h</a> - Header file for <a href="#">hex2otf.c</a> . . . . .	192
<a href="#">src/johab2syllables.c</a>	Create the Unicode Hangul Syllables block from component letters . . . . .	196
<a href="#">src/unibdf2hex.c</a>	Unibdf2hex - Convert a BDF file into a unifont.hex file . . . . .	202
<a href="#">src/unibmp2hex.c</a>	Unibmp2hex - Turn a .bmp or .wbmp glyph matrix into a GNU Unifont hex glyph set of 256 characters . . . . .	206
<a href="#">src/unibmpbump.c</a>	Unibmpbump - Adjust a Microsoft bitmap (.bmp) file that was created by unihex2png but converted to .bmp . . . . .	227
<a href="#">src/unicoverage.c</a>	Unicoverage - Show the coverage of Unicode plane scripts for a GNU Unifont hex glyph file	244
<a href="#">src/unidup.c</a>	Unidup - Check for duplicate code points in sorted unifont.hex file . . . . .	254
<a href="#">src/unifont-support.c</a>	: Support functions for Unifont .hex files . . . . .	258
<a href="#">src/unifont1per.c</a>	Unifont1per - Read a Unifont .hex file from standard input and produce one glyph per ".bmp" bitmap file as output . . . . .	270
<a href="#">src/unifontpic.c</a>	Unifontpic - See the "Big Picture": the entire Unifont in one BMP bitmap . . . . .	275
<a href="#">src/unifontpic.h</a>	<a href="#">Unifontpic.h</a> - Header file for <a href="#">unifontpic.c</a> . . . . .	303
<a href="#">src/unigen-hangul.c</a>	Generate arbitrary hangul syllables . . . . .	308

---

src/ <a href="#">unigencircles.c</a>	
Unigencircles - Superimpose dashed combining circles on combining glyphs . . . . .	319
src/ <a href="#">unigenwidth.c</a>	
Unigenwidth - IEEE 1003.1-2008 setup to calculate wchar_t string widths . . . . .	329
src/ <a href="#">unihangul-support.c</a>	
Functions for converting Hangul letters into syllables . . . . .	339
src/ <a href="#">unihex2bmp.c</a>	
Unihex2bmp - Turn a GNU Unifont hex glyph page of 256 code points into a bitmap for editing . . . . .	380
src/ <a href="#">unihexgen.c</a>	
Unihexgen - Generate a series of glyphs containing hexadecimal code points . . . . .	397
src/ <a href="#">unihexpose.c</a> . . . . .	407
src/ <a href="#">unijohab2html.c</a>	
Display overlapped Hangul letter combinations in a grid . . . . .	408
src/ <a href="#">unipagecount.c</a>	
Unipagecount - Count the number of glyphs defined in each page of 256 code points . . . .	427

# Chapter 4

## Data Structure Documentation

### 4.1 Buffer Struct Reference

Generic data structure for a linked list of buffer elements.

#### Data Fields

- [size\\_t capacity](#)
- [byte \\* begin](#)
- [byte \\* next](#)
- [byte \\* end](#)

#### 4.1.1 Detailed Description

Generic data structure for a linked list of buffer elements.

A buffer can act as a vector (when filled with 'store\*' functions), or a temporary output area (when filled with 'cache\*' functions). The 'store\*' functions use native endian. The 'cache\*' functions use big endian or other formats in OpenType. Beware of memory alignment.

Definition at line [133](#) of file [hex2otf.c](#).

#### 4.1.2 Field Documentation

##### 4.1.2.1 begin

[byte\\*](#) Buffer::begin

Definition at line [136](#) of file [hex2otf.c](#).

#### 4.1.2.2 capacity

size\_t Buffer::capacity

Definition at line 135 of file [hex2otf.c](#).

#### 4.1.2.3 end

byte \* Buffer::end

Definition at line 136 of file [hex2otf.c](#).

#### 4.1.2.4 next

byte \* Buffer::next

Definition at line 136 of file [hex2otf.c](#).

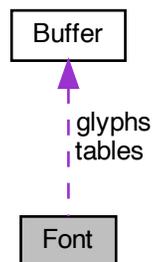

The documentation for this struct was generated from the following file:

- [src/hex2otf.c](#)

## 4.2 Font Struct Reference

Data structure to hold information for one font.

Collaboration diagram for Font:

## Data Fields

- [Buffer \\* tables](#)
- [Buffer \\* glyphs](#)
- [uint\\_fast32\\_t glyphCount](#)
- [pixels\\_t maxWidth](#)

### 4.2.1 Detailed Description

Data structure to hold information for one font.

Definition at line [628](#) of file [hex2otf.c](#).

### 4.2.2 Field Documentation

#### 4.2.2.1 glyphCount

`uint_fast32_t Font::glyphCount`

Definition at line [632](#) of file [hex2otf.c](#).

#### 4.2.2.2 glyphs

`Buffer* Font::glyphs`

Definition at line [631](#) of file [hex2otf.c](#).

#### 4.2.2.3 maxWidth

`pixels_t Font::maxWidth`

Definition at line [633](#) of file [hex2otf.c](#).

#### 4.2.2.4 tables

[Buffer\\*](#) `Font::tables`

Definition at line [630](#) of file [hex2otf.c](#).

The documentation for this struct was generated from the following file:

- [src/hex2otf.c](#)

### 4.3 Glyph Struct Reference

Data structure to hold data for one bitmap glyph.

#### Data Fields

- `uint_least32_t` [codePoint](#)  
undefined for glyph 0
- `byte` [bitmap](#) [[GLYPH\\_MAX\\_BYTE\\_COUNT](#)]  
hexadecimal bitmap character array
- `uint_least8_t` [byteCount](#)  
length of bitmap data
- `bool` [combining](#)  
whether this is a combining glyph
- `pixels_t` [pos](#)
- `pixels_t` [lsb](#)  
left side bearing (x position of leftmost contour point)

#### 4.3.1 Detailed Description

Data structure to hold data for one bitmap glyph.

This data structure holds data to represent one Unifont bitmap glyph: Unicode code point, number of bytes in its bitmap array, whether or not it is a combining character, and an offset from the glyph origin to the start of the bitmap.

Definition at line [614](#) of file [hex2otf.c](#).

#### 4.3.2 Field Documentation

#### 4.3.2.1 bitmap

`byte` Glyph::bitmap[GLYPH\_MAX\_BYTE\_COUNT]

hexadecimal bitmap character array

Definition at line 617 of file [hex2otf.c](#).

#### 4.3.2.2 byteCount

`uint_least8_t` Glyph::byteCount

length of bitmap data

Definition at line 618 of file [hex2otf.c](#).

#### 4.3.2.3 codePoint

`uint_least32_t` Glyph::codePoint

undefined for glyph 0

Definition at line 616 of file [hex2otf.c](#).

#### 4.3.2.4 combining

`bool` Glyph::combining

whether this is a combining glyph

Definition at line 619 of file [hex2otf.c](#).

#### 4.3.2.5 lsb

`pixels_t` Glyph::lsb

left side bearing (x position of leftmost contour point)

Definition at line 622 of file [hex2otf.c](#).

#### 4.3.2.6 pos

`pixels_t Glyph::pos`

number of pixels the glyph should be moved to the right (negative number means moving to the left)

Definition at line [620](#) of file [hex2otf.c](#).

The documentation for this struct was generated from the following file:

- [src/hex2otf.c](#)

## 4.4 NamePair Struct Reference

Data structure for a font ID number and name character string.

```
#include <hex2otf.h>
```

### Data Fields

- `int id`
- `const char * str`

#### 4.4.1 Detailed Description

Data structure for a font ID number and name character string.

Definition at line [77](#) of file [hex2otf.h](#).

#### 4.4.2 Field Documentation

##### 4.4.2.1 id

`int NamePair::id`

Definition at line [79](#) of file [hex2otf.h](#).

#### 4.4.2.2 str

const char\* NamePair::str

Definition at line 80 of file [hex2otf.h](#).

The documentation for this struct was generated from the following file:

- [src/hex2otf.h](#)

## 4.5 Options Struct Reference

Data structure to hold options for OpenType font output.

### Data Fields

- bool [truetype](#)
- bool [blankOutline](#)
- bool [bitmap](#)
- bool [gpos](#)
- bool [gsub](#)
- int [cff](#)
- const char \* [hex](#)
- const char \* [pos](#)
- const char \* [out](#)
- [NameStrings](#) [nameStrings](#)

### 4.5.1 Detailed Description

Data structure to hold options for OpenType font output.

This data structure holds the status of options that can be specified as command line arguments for creating the output OpenType font file.

Definition at line 2453 of file [hex2otf.c](#).

### 4.5.2 Field Documentation

#### 4.5.2.1 bitmap

bool Options::bitmap

Definition at line 2455 of file [hex2otf.c](#).

#### 4.5.2.2 blankOutline

bool Options::blankOutline

Definition at line [2455](#) of file [hex2otf.c](#).

#### 4.5.2.3 cff

int Options::cff

Definition at line [2456](#) of file [hex2otf.c](#).

#### 4.5.2.4 gpos

bool Options::gpos

Definition at line [2455](#) of file [hex2otf.c](#).

#### 4.5.2.5 gsub

bool Options::gsub

Definition at line [2455](#) of file [hex2otf.c](#).

#### 4.5.2.6 hex

const char\* Options::hex

Definition at line [2457](#) of file [hex2otf.c](#).

#### 4.5.2.7 nameStrings

[NameStrings](#) Options::nameStrings

Definition at line [2458](#) of file [hex2otf.c](#).

#### 4.5.2.8 out

const char \* Options::out

Definition at line [2457](#) of file [hex2otf.c](#).

#### 4.5.2.9 pos

const char \* Options::pos

Definition at line [2457](#) of file [hex2otf.c](#).

#### 4.5.2.10 truetype

bool Options::truetype

Definition at line [2455](#) of file [hex2otf.c](#).

The documentation for this struct was generated from the following file:

- [src/hex2otf.c](#)

## 4.6 PARAMS Struct Reference

### Data Fields

- unsigned [starting\\_codept](#)
- unsigned [cho\\_start](#)
- unsigned [cho\\_end](#)
- unsigned [jung\\_start](#)
- unsigned [jung\\_end](#)
- unsigned [jong\\_start](#)
- unsigned [jong\\_end](#)
- FILE \* [infp](#)
- FILE \* [outfp](#)

#### 4.6.1 Detailed Description

Definition at line [55](#) of file [unigen-hangul.c](#).

## 4.6.2 Field Documentation

### 4.6.2.1 cho\_end

unsigned PARAMS::cho\_end

Definition at line 57 of file [unigen-hangul.c](#).

### 4.6.2.2 cho\_start

unsigned PARAMS::cho\_start

Definition at line 57 of file [unigen-hangul.c](#).

### 4.6.2.3 infp

FILE\* PARAMS::infp

Definition at line 60 of file [unigen-hangul.c](#).

### 4.6.2.4 jong\_end

unsigned PARAMS::jong\_end

Definition at line 59 of file [unigen-hangul.c](#).

### 4.6.2.5 jong\_start

unsigned PARAMS::jong\_start

Definition at line 59 of file [unigen-hangul.c](#).

#### 4.6.2.6 jung\_end

unsigned PARAMS::jung\_end

Definition at line 58 of file [unigen-hangul.c](#).

#### 4.6.2.7 jung\_start

unsigned PARAMS::jung\_start

Definition at line 58 of file [unigen-hangul.c](#).

#### 4.6.2.8 outfp

FILE\* PARAMS::outfp

Definition at line 61 of file [unigen-hangul.c](#).

#### 4.6.2.9 starting\_codept

unsigned PARAMS::starting\_codept

Definition at line 56 of file [unigen-hangul.c](#).

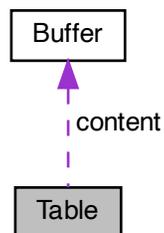

The documentation for this struct was generated from the following file:

- [src/unigen-hangul.c](#)

## 4.7 Table Struct Reference

Data structure for an OpenType table.

Collaboration diagram for Table:

## Data Fields

- `uint_fast32_t tag`
- `Buffer * content`

### 4.7.1 Detailed Description

Data structure for an OpenType table.

This data structure contains a table tag and a pointer to the start of the buffer that holds data for this OpenType table.

For information on the OpenType tables and their structure, see <https://docs.microsoft.com/en-us/typography/opentype/spec/otff#font-tables>.

Definition at line 645 of file `hex2otf.c`.

### 4.7.2 Field Documentation

#### 4.7.2.1 content

`Buffer* Table::content`

Definition at line 648 of file `hex2otf.c`.

#### 4.7.2.2 tag

`uint_fast32_t Table::tag`

Definition at line 647 of file `hex2otf.c`.

The documentation for this struct was generated from the following file:

- `src/hex2otf.c`

## 4.8 TableRecord Struct Reference

Data structure for data associated with one OpenType table.

## Data Fields

- `uint_least32_t` [tag](#)
- `uint_least32_t` [offset](#)
- `uint_least32_t` [length](#)
- `uint_least32_t` [checksum](#)

### 4.8.1 Detailed Description

Data structure for data associated with one OpenType table.

This data structure contains an OpenType table's tag, start within an OpenType font file, length in bytes, and checksum at the end of the table.

Definition at line [747](#) of file [hex2otf.c](#).

### 4.8.2 Field Documentation

#### 4.8.2.1 checksum

`uint_least32_t` `TableRecord::checksum`

Definition at line [749](#) of file [hex2otf.c](#).

#### 4.8.2.2 length

`uint_least32_t` `TableRecord::length`

Definition at line [749](#) of file [hex2otf.c](#).

#### 4.8.2.3 offset

`uint_least32_t` `TableRecord::offset`

Definition at line [749](#) of file [hex2otf.c](#).

#### 4.8.2.4 tag

`uint_least32_t` `TableRecord::tag`

Definition at line [749](#) of file [hex2otf.c](#).

The documentation for this struct was generated from the following file:

- [src/hex2otf.c](#)

# Chapter 5

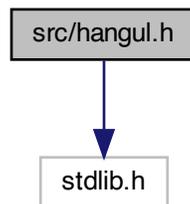

## File Documentation

### 5.1 src/hangul.h File Reference

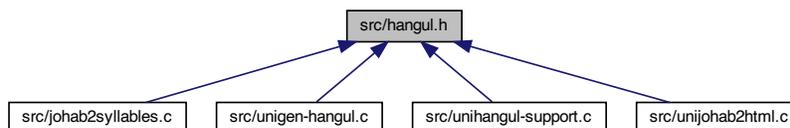

Define constants and function prototypes for using Hangul glyphs.

```
#include <stdlib.h>
```

Include dependency graph for hangul.h:

This graph shows which files directly or indirectly include this file:

## Macros

- #define `MAXLINE` 256  
Length of maximum file input line.
- #define `EXTENDED_HANGUL` /\* Use rare Hangul code points beyond U+1100 \*/
- #define `PUA_START` 0xE000
- #define `PUA_END` 0xE8FF
- #define `MAX_GLYPHS` (PUA\_END - PUA\_START + 1) /\* Maximum .hex file glyphs \*/
- #define `CHO_UNICODE_START` 0x1100  
Modern Hangul choseong start.

End of U+D7B0..U+D7FF glyphs.
- `#define TOTAL_CHO (NCHO_MODERN + NCHO_ANCIENT + NCHO_EXT_A )`
- `#define TOTAL_JUNG (NJUNG_MODERN + NJUNG_ANCIENT + NJUNG_EXTB)`
- `#define TOTAL_JONG (NJONG_MODERN + NJONG_ANCIENT + NJONG_EXTB)`

## Functions

- unsigned `hangul_read_base8` (FILE \*infp, unsigned char base[][32])  
Read hangul-base.hex file into a unsigned char array.
- unsigned `hangul_read_base16` (FILE \*infp, unsigned base[][16])  
Read hangul-base.hex file into a unsigned array.
- void `hangul_decompose` (unsigned codept, int \*initial, int \*medial, int \*final)  
Decompose a Hangul Syllables code point into three letters.
- unsigned `hangul_compose` (int initial, int medial, int final)  
Compose a Hangul syllable into a code point, or 0 if none exists.
- void `hangul_hex_indices` (int choseong, int jungseong, int jongseong, int \*cho\_index, int \*jung\_index, int \*jong\_index)  
Determine index values to the bitmaps for a syllable's components.
- void `hangul_variations` (int choseong, int jungseong, int jongseong, int \*cho\_var, int \*jung\_var, int \*jong\_var)  
Determine the variations of each letter in a Hangul syllable.
- int `is_wide_vowel` (int vowel)  
Whether vowel has rightmost vertical stroke to the right.
- int `cho_variation` (int choseong, int jungseong, int jongseong)  
Return the Johab 6/3/1 choseong variation for a syllable.
- int `jung_variation` (int choseong, int jungseong, int jongseong)  
Return the Johab 6/3/1 jungseong variation.
- int `jong_variation` (int choseong, int jungseong, int jongseong)  
Return the Johab 6/3/1 jongseong variation.
- void `hangul_syllable` (int choseong, int jungseong, int jongseong, unsigned char hangul\_base[][32], unsigned char \*syllable)  
Given letters in a Hangul syllable, return a glyph.
- int `glyph_overlap` (unsigned \*glyph1, unsigned \*glyph2)  
See if two glyphs overlap.
- void `combine_glyphs` (unsigned \*glyph1, unsigned \*glyph2, unsigned \*combined\_glyph)  
Combine two glyphs into one glyph.
- void `one_jamo` (unsigned glyph\_table[MAX\_GLYPHS][16], unsigned jamo, unsigned \*jamo\_glyph)  
Convert Hangul Jamo choseong, jungseong, and jongseong into a glyph.
- void `combined_jamo` (unsigned glyph\_table[MAX\_GLYPHS][16], unsigned cho, unsigned jung, unsigned jong, unsigned \*combined\_glyph)  
Convert Hangul Jamo choseong, jungseong, and jongseong into a glyph.
- void `print_glyph_txt` (FILE \*fp, unsigned codept, unsigned \*this\_glyph)  
Print one glyph in Unifont hexdraw plain text style.
- void `print_glyph_hex` (FILE \*fp, unsigned codept, unsigned \*this\_glyph)  
Print one glyph in Unifont hexdraw hexadecimal string style.

### 5.1.1 Detailed Description

Define constants and function prototypes for using Hangul glyphs.

### 5.1.2 Macro Definition Documentation

#### 5.1.2.1 CHO\_ANCIENT\_HEX

```
#define CHO_ANCIENT_HEX (CHO_HEX + CHO_VARIATIONS * NCHO_MODERN)
```

Location of first ancient choseong.

Definition at line 99 of file [hangul.h](#).

#### 5.1.2.2 CHO\_EXT\_A\_HEX

```
#define CHO_EXT_A_HEX (CHO_ANCIENT_HEX + CHO_VARIATIONS * NCHO_ANCIENT)
```

U+A960 Extended-A choseong.

Definition at line 102 of file [hangul.h](#).

#### 5.1.2.3 CHO\_EXT\_A\_UNICODE\_END

```
#define CHO_EXT_A_UNICODE_END 0xA97C
```

Hangul Extended-A choseong end.

Definition at line 53 of file [hangul.h](#).

#### 5.1.2.4 CHO\_EXTA\_UNICODE\_START

```
#define CHO_EXTA_UNICODE_START 0xA960
```

Hangul Extended-A choseong start.

Definition at line [52](#) of file [hangul.h](#).

#### 5.1.2.5 CHO\_HEX

```
#define CHO_HEX 0x0001
```

Location of first choseong (location 0x0000 is a blank glyph)

Definition at line [96](#) of file [hangul.h](#).

#### 5.1.2.6 CHO\_LAST\_HEX

```
#define CHO_LAST_HEX (CHO_EXTA_HEX + CHO_VARIATIONS * (NCHO_EXTA + NCHO_EXTA_RSRVD) - 1)
```

U+A97F Extended-A last location in .hex file, including reserved Unicode code points at end.

Definition at line [105](#) of file [hangul.h](#).

#### 5.1.2.7 CHO\_UNICODE\_END

```
#define CHO_UNICODE_END 0x115E
```

Hangul Jamo choseong end.

Definition at line [51](#) of file [hangul.h](#).

#### 5.1.2.8 CHO\_UNICODE\_START

```
#define CHO_UNICODE_START 0x1100
```

Modern Hangul choseong start.

Definition at line [50](#) of file [hangul.h](#).

### 5.1.2.9 CHO\_VARIATIONS

```
#define CHO_VARIATIONS 6
```

6 choseong variations

Definition at line 88 of file [hangul.h](#).

### 5.1.2.10 EXTENDED\_HANGUL

```
#define EXTENDED_HANGUL /* Use rare Hangul code points beyond U+1100 */
```

Definition at line 35 of file [hangul.h](#).

### 5.1.2.11 JAMO\_END

```
#define JAMO_END 0x05FF
```

End of U+1100..U+11FF glyphs.

Definition at line 133 of file [hangul.h](#).

### 5.1.2.12 JAMO\_EXTA\_END

```
#define JAMO_EXTA_END 0x061F
```

End of U+A960..U+A97F glyphs.

Definition at line 137 of file [hangul.h](#).

### 5.1.2.13 JAMO\_EXTA\_HEX

```
#define JAMO_EXTA_HEX 0x0600
```

Start of U+A960..U+A97F glyphs.

Definition at line 136 of file [hangul.h](#).

#### 5.1.2.14 JAMO\_EXTB\_END

```
#define JAMO_EXTB_END 0x066F
```

End of U+D7B0..U+D7FF glyphs.

Definition at line [141](#) of file [hangul.h](#).

#### 5.1.2.15 JAMO\_EXTB\_HEX

```
#define JAMO_EXTB_HEX 0x0620
```

Start of U+D7B0..U+D7FF glyphs.

Definition at line [140](#) of file [hangul.h](#).

#### 5.1.2.16 JAMO\_HEX

```
#define JAMO_HEX 0x0500
```

Start of U+1100..U+11FF glyphs.

Definition at line [132](#) of file [hangul.h](#).

#### 5.1.2.17 JONG\_ANCIENT\_HEX

```
#define JONG_ANCIENT_HEX (JONG_HEX + JONG_VARIATIONS * NJONG_MODERN)
```

Location of first ancient jongseong.

Definition at line [123](#) of file [hangul.h](#).

#### 5.1.2.18 JONG\_EXTB\_HEX

```
#define JONG_EXTB_HEX (JONG_ANCIENT_HEX + JONG_VARIATIONS * NJONG_ANCIENT)
```

U+D7CB Extended-B jongseong.

Definition at line [126](#) of file [hangul.h](#).

#### 5.1.2.19 JONG\_EXTB\_UNICODE\_END

```
#define JONG_EXTB_UNICODE_END 0xD7FB
```

Hangul Extended-B jongseong end.

Definition at line [63](#) of file [hangul.h](#).

#### 5.1.2.20 JONG\_EXTB\_UNICODE\_START

```
#define JONG_EXTB_UNICODE_START 0xD7CB
```

Hangul Extended-B jongseong start.

Definition at line [62](#) of file [hangul.h](#).

#### 5.1.2.21 JONG\_HEX

```
#define JONG_HEX (JONG_LAST_HEX + 1)
```

Location of first jongseong (will be 0x421)

Definition at line [120](#) of file [hangul.h](#).

#### 5.1.2.22 JONG\_LAST\_HEX

```
#define JONG_LAST_HEX (JONG_EXTB_HEX + JONG_VARIATIONS * (NJONG_EXTB + NJONG_EXTB_RSRVD) - 1)
```

U+D7FF Extended-B last location in .hex file, including reserved Unicode code points at end.

Definition at line [129](#) of file [hangul.h](#).

#### 5.1.2.23 JONG\_UNICODE\_END

```
#define JONG_UNICODE_END 0x11FF
```

Modern Hangul jongseong end.

Definition at line [61](#) of file [hangul.h](#).

#### 5.1.2.24 JONG\_UNICODE\_START

```
#define JONG_UNICODE_START 0x11A8
```

Modern Hangul jongseong start.

Definition at line [60](#) of file [hangul.h](#).

#### 5.1.2.25 JONG\_VARIATIONS

```
#define JONG_VARIATIONS 1
```

1 jongseong variation

Definition at line [90](#) of file [hangul.h](#).

#### 5.1.2.26 JUNG\_ANCIENT\_HEX

```
#define JUNG_ANCIENT_HEX (JUNG_HEX + JUNG_VARIATIONS * NJUNG_MODERN)
```

Location of first ancient jungseong.

Definition at line [111](#) of file [hangul.h](#).

#### 5.1.2.27 JUNG\_EXTB\_HEX

```
#define JUNG_EXTB_HEX (JUNG_ANCIENT_HEX + JUNG_VARIATIONS * NJUNG_ANCIENT)
```

U+D7B0 Extended-B jungseong.

Definition at line [114](#) of file [hangul.h](#).

#### 5.1.2.28 JUNG\_EXTB\_UNICODE\_END

```
#define JUNG_EXTB_UNICODE_END 0xD7C6
```

Hangul Extended-B jungseong end.

Definition at line [58](#) of file [hangul.h](#).

#### 5.1.2.29 JUNG\_EXTB\_UNICODE\_START

```
#define JUNG_EXTB_UNICODE_START 0xD7B0
```

Hangul Extended-B jungseong start.

Definition at line 57 of file [hangul.h](#).

#### 5.1.2.30 JUNG\_HEX

```
#define JUNG_HEX (CHO_LAST_HEX + 1)
```

Location of first jungseong (will be 0x2FB)

Definition at line 108 of file [hangul.h](#).

#### 5.1.2.31 JUNG\_LAST\_HEX

```
#define JUNG_LAST_HEX (JUNG_EXTB_HEX + JUNG_VARIATIONS * (NJUNG_EXTB + NJUNG_EXTB_RSRVD) - 1)
```

U+D7CA Extended-B last location in .hex file, including reserved Unicode code points at end.

Definition at line 117 of file [hangul.h](#).

#### 5.1.2.32 JUNG\_UNICODE\_END

```
#define JUNG_UNICODE_END 0x11A7
```

Modern Hangul jungseong end.

Definition at line 56 of file [hangul.h](#).

#### 5.1.2.33 JUNG\_UNICODE\_START

```
#define JUNG_UNICODE_START 0x1161
```

Modern Hangul jungseong start.

Definition at line 55 of file [hangul.h](#).

#### 5.1.2.34 JUNG\_VARIATIONS

```
#define JUNG_VARIATIONS 3
```

3 jungseong variations

Definition at line [89](#) of file [hangul.h](#).

#### 5.1.2.35 MAX\_GLYPHS

```
#define MAX_GLYPHS (PUA_END - PUA_START + 1) /* Maximum .hex file glyphs */
```

Definition at line [40](#) of file [hangul.h](#).

#### 5.1.2.36 MAXLINE

```
#define MAXLINE 256
```

Length of maximum file input line.

Definition at line [33](#) of file [hangul.h](#).

#### 5.1.2.37 NCHO\_ANCIENT

```
#define NCHO_ANCIENT 76
```

ancient Hangul Jamo choseong

Definition at line [70](#) of file [hangul.h](#).

#### 5.1.2.38 NCHO\_EXT\_A

```
#define NCHO_EXT_A 29
```

Hangul Extended-A choseong.

Definition at line [71](#) of file [hangul.h](#).

#### 5.1.2.39 NCHO\_EXT\_A\_RSRVD

```
#define NCHO_EXT_A_RSRVD 3
```

Reserved at end of Extended-A choseong.

Definition at line 72 of file [hangul.h](#).

#### 5.1.2.40 NCHO\_MODERN

```
#define NCHO_MODERN 19
```

19 modern Hangul Jamo choseong

Definition at line 69 of file [hangul.h](#).

#### 5.1.2.41 NJONG\_ANTIEN

```
#define NJONG_ANTIEN 61
```

ancient Hangul Jamo jongseong

Definition at line 80 of file [hangul.h](#).

#### 5.1.2.42 NJONG\_EXTB

```
#define NJONG_EXTB 49
```

Hangul Extended-B jongseong.

Definition at line 81 of file [hangul.h](#).

#### 5.1.2.43 NJONG\_EXTB\_RSRVD

```
#define NJONG_EXTB_RSRVD 4
```

Reserved at end of Extended-B jonseong.

Definition at line 82 of file [hangul.h](#).

#### 5.1.2.44 NJONG\_MODERN

```
#define NJONG_MODERN 27
```

28 modern Hangul Jamo jongseong

Definition at line [79](#) of file [hangul.h](#).

#### 5.1.2.45 NJUNG\_ANCIENT

```
#define NJUNG_ANCIENT 50
```

ancient Hangul Jamo jungseong

Definition at line [75](#) of file [hangul.h](#).

#### 5.1.2.46 NJUNG\_EXTB

```
#define NJUNG_EXTB 23
```

Hangul Extended-B jungseong.

Definition at line [76](#) of file [hangul.h](#).

#### 5.1.2.47 NJUNG\_EXTB\_RSRVD

```
#define NJUNG_EXTB_RSRVD 4
```

Reserved at end of Extended-B junseong.

Definition at line [77](#) of file [hangul.h](#).

#### 5.1.2.48 NJUNG\_MODERN

```
#define NJUNG_MODERN 21
```

21 modern Hangul Jamo jungseong

Definition at line [74](#) of file [hangul.h](#).

#### 5.1.2.49 PUA\_END

```
#define PUA_END 0xE8FF
```

Definition at line [39](#) of file [hangul.h](#).

#### 5.1.2.50 PUA\_START

```
#define PUA_START 0xE000
```

Definition at line [38](#) of file [hangul.h](#).

#### 5.1.2.51 TOTAL\_CHO

```
#define TOTAL_CHO (NCHO_MODERN + NCHO_ANCIENT + NCHO_EXT_A )
```

Definition at line [150](#) of file [hangul.h](#).

#### 5.1.2.52 TOTAL\_JONG

```
#define TOTAL_JONG (NJONG_MODERN + NJONG_ANCIENT + NJONG_EXTB)
```

Definition at line [152](#) of file [hangul.h](#).

#### 5.1.2.53 TOTAL\_JUNG

```
#define TOTAL_JUNG (NJUNG_MODERN + NJUNG_ANCIENT + NJUNG_EXTB)
```

Definition at line [151](#) of file [hangul.h](#).

### 5.1.3 Function Documentation

### 5.1.3.1 cho\_variation()

```
int cho_variation (
    int choseong,
    int jungseong,
    int jongseong )
```

Return the Johab 6/3/1 choseong variation for a syllable.

This function takes the two or three (if jongseong is included) letters that comprise a syllable and determine the variation of the initial consonant (choseong).

Each choseong has 6 variations:

#### Variation Occurrence

0 Choseong with a vertical vowel such as "A". 1 Choseong with a horizontal vowel such as "O". 2 Choseong with a vertical and horizontal vowel such as "WA". 3 Same as variation 0, but with jongseong (final consonant). 4 Same as variation 1, but with jongseong (final consonant). Also a horizontal vowel pointing down, such as U and YU. 5 Same as variation 2, but with jongseong (final consonant). Also a horizontal vowel pointing down with vertical element, such as WEO, WE, and WI.

In addition, if the vowel is horizontal and a downward-pointing stroke as in the modern letters U, WEO, WE, WI, and YU, and in archaic letters YU-YEO, YU-YE, YU-I, araea, and araea-i, then 3 is added to the initial variation of 0 to 2, resulting in a choseong variation of 3 to 5, respectively.

#### Parameters

in	choseong	The 1st letter in the syllable.
in	jungseong	The 2nd letter in the syllable.
in	jongseong	The 3rd letter in the syllable.

#### Returns

The choseong variation, 0 to 5.

Definition at line 350 of file [unihangul-support.c](#).

### 5.1.3.2 combine\_glyphs()

```

void combine_glyphs (
    unsigned * glyph1,
    unsigned * glyph2,
    unsigned * combined_glyph )
  
```

Combine two glyphs into one glyph.

Parameters

in	glyph1	The first glyph to overlap.
in	glyph2	The second glyph to overlap.

## Parameters

out	combined_glyph	The re-returned combination glyph.
-----	----------------	------------------------------------

### 5.1.3.3 combined\_jamo()

```

void combined_jamo (
    unsigned glyph_table[MAX_GLYPHS][16],
    unsigned cho,
    unsigned jung,
    unsigned jong,
    unsigned * combined_glyph )

```

Convert Hangul Jamo choseong, jungseong, and jongseong into a glyph.

This function converts input Hangul choseong, jungseong, and jongseong Unicode code triplets into a Hangul syllable. Any of those with an out of range code point are assigned a blank glyph for combining.

This function performs the following steps:

- 1) Determine the sequence number of choseong, jungseong, and jongseong, from 0 to the total number of choseong, jungseong, or jongseong, respectively, minus one. The sequence for each is as follows:
  - a) Choseong: Unicode code points of U+1100..U+115E and then U+A960..U+A97C.
  - b) Jungseong: Unicode code points of U+1161..U+11A7 and then U+D7B0..U+D7C6.
  - c) Jongseong: Unicode code points of U+11A8..U+11FF and then U+D7CB..U+D7FB.

- 2) From the choseong, jungseong, and jongseong sequence number, determine the variation of choseong and jungseong (there is only one jongseong variation, although it is shifted right by one column for some vowels with a pair of long vertical strokes on the right side).
- 3) Convert the variation numbers for the three syllable components to index locations in the glyph array.
- 4) Combine the glyph array glyphs into a syllable.

## Parameters

in	glyph_table	The collection of all jamo glyphs.
in	cho	The choseong Unicode code point, 0 or 0x1100..0x115F.
in	jung	The jungseong Unicode code point, 0 or 0x1160..0x11A7.
in	jong	The jongseong Unicode code point, 0 or 0x11A8..0x11FF.
out	combined_glyph	The output glyph, 16 columns in each of 16 rows.

#### 5.1.3.4 glyph\_overlap()

```
int glyph_overlap (
    unsigned * glyph1,
    unsigned * glyph2 )
```

See if two glyphs overlap.

Parameters

in	glyph1	The first glyph, as a 16-row bitmap.
----	--------	--------------------------------------

## Parameters

in	glyph2	The second glyph, as a 16-row bitmap.
----	--------	---------------------------------------

## Returns

0 if no overlaps between glyphs, 1 otherwise.

Definition at line 613 of file unihangul-support.c.

```

00613     {
00614     int overlaps; /* Return value; 0 if no overlaps, -1 if overlaps. */
00615     int i;
00616

00623     } while (i < 16 && overlaps == 0);
00624
00625     return overlaps;
00626 }

```

## 5.1.3.5 hangul\_compose()

```

unsigned hangul_compose (
    int initial,
    int medial,
    int final )

```

Compose a Hangul syllable into a code point, or 0 if none exists.

This function takes three letters that can form a modern Hangul syllable and returns the corresponding Unicode Hangul Syllables code point in the range 0xAC00 to 0xD7A3.

If a three-letter combination includes one or more archaic letters, it will not map into the Hangul Syllables range. In that case, the returned code point will be 0 to indicate that no valid Hangul Syllables code point exists.

## Parameters

in	initial	The first letter (choseong), 0 to 18.
in	medial	The second letter (jungseong), 0 to 20.

## Parameters

in	final	The third letter (jongseong), 0 to 26 or -1 if none.
----	-------	--

## Returns

The Unicode Hangul Syllables code point, 0xAC00 to 0xD7A3.

Definition at line 201 of file [unihangul-support.c](#).

```

00201     {
00202     unsigned codept;
00203
00204
00205     if (initial >= 0 && initial <= 18 &&
00206         medial >= 0 && medial <= 20 &&
00207         final >= 0 && final <= 26) {
00208
00209         codept = 0xAC00;
00210         codept += initial * 21 * 28;
00211         codept += medial * 28;
00212         codept += final + 1;
00213     }
00214     else {
00215         codept = 0;
00216     }
00217
00218     return codept;
00219 }

```

## 5.1.3.6 hangul\_decompose()

```

void hangul_decompose (
    unsigned codept,
    int * initial,
    int * medial,
    int * final )

```

Decompose a Hangul Syllables code point into three letters.

Decompose a Hangul Syllables code point (U+AC00..U+D7A3) into:

- Choseong 0-19
- Jungseong 0-20
- Jongseong 0-27 or -1 if no jongseong

All letter values are set to -1 if the letters do not form a syllable in the Hangul Syllables range. This function only handles modern Hangul, because that is all that is in the Hangul Syllables range.

## Parameters

in	codept	The Unicode code point to decode, from 0xAC00 to 0xD7A3.
out	initial	The 1st letter (choseong) in the syllable.
out	initial	The 2nd letter (jungseong) in the syllable.
out	initial	The 3rd letter (jongseong) in the syllable.

Definition at line 167 of file [unihangul-support.c](#).

```

00167 {
00168
00169     if (codept < 0xAC00 || codept > 0xD7A3) {
00170         *initial = *medial = *final = -1;
00171     }
00172     else {
00173         codept -= 0xAC00;
00174         *initial = codept / (28 * 21);
00175         *medial = (codept / 28) % 21;
00176         *final = codept % 28 - 1;
00177     }
00178
00179     return;
00180 }

```

Here is the caller graph for this function:

### 5.1.3.7 hangul\_hex\_indices()

```

void hangul_hex_indices (
    int choseong,
    int jungseong,
    int jongseong,
    int * cho_index,
    int * jung_index,
    int * jong_index )
  
```

Determine index values to the bitmaps for a syllable's components.

This function reads these input values for modern and ancient Hangul letters:

- Choseong number (0 to the number of modern and archaic choseong - 1).
- Jungseong number (0 to the number of modern and archaic jungseong - 1).
- Jongseong number (0 to the number of modern and archaic jongseong - 1, or -1 if none).

It then determines the variation of each letter given the combination with the other two letters (or just choseong and jungseong if the jongseong value is -1).

These variations are then converted into index locations within the glyph array that was read in from the hangul-base.hex file. Those index locations can then be used to form a composite syllable.

There is no restriction to only use the modern Hangul letters.

Parameters

in	choseong	The 1st letter in the syllable.
in	jungseong	The 2nd letter in the syllable.

## Parameters

in	jongseong	The 3rd letter in the syllable, or -1 if none.
out	cho_index	Index location to the 1st letter variation from the hangul-base.hex file.
out	jung_index	Index location to the 2nd letter variation from the hangul-base.hex file.
out	jong_index	Index location to the 3rd letter variation from the hangul-base.hex file.

### 5.1.3.8 hangul\_read\_base16()

```

unsigned hangul_read_base16 (
    FILE * infp,
    unsigned base[][16] )

```

Read hangul-base.hex file into a unsigned array.

Read a Hangul base .hex file with separate choseong, jungseong, and jongseong glyphs for syllable formation. The order is:

- Empty glyph in 0x0000 position.
- Initial consonants (choseong).
- Medial vowels and diphthongs (jungseong).

- Final consonants (jongseong).
- Individual letter forms in isolation, not for syllable formation.

The letters are arranged with all variations for one letter before continuing to the next letter. In the current encoding, there are 6 variations of choseong, 3 of jungseong, and 1 of jongseong per letter.

#### Parameters

in	Input	file pointer; can be stdin.
out	Array	of bit patterns, with 16 16-bit values per letter.

#### Returns

The maximum code point value read in the file.

Definition at line 116 of file [unihangul-support.c](#).

```

00116                                     {

### 5.1.3.9 hangul\_read\_base8()

```

unsigned hangul_read_base8 (
    FILE * infp,
    unsigned char base[][32] )
  
```

Read hangul-base.hex file into a unsigned char array.

Read a Hangul base .hex file with separate choseong, jungseong, and jongseong glyphs for syllable formation. The order is:

- Empty glyph in 0x0000 position.
- Initial consonants (choseong).
- Medial vowels and diphthongs (jungseong).
- Final consonants (jongseong).
- Individual letter forms in isolation, not for syllable formation.

The letters are arranged with all variations for one letter before continuing to the next letter. In the current encoding, there are 6 variations of choseong, 3 of jungseong, and 1 of jongseong per letter.

Parameters

in	Input	file pointer; can be stdin.
out	Array	of bit patterns, with 32 8-bit values per letter.

## Returns

The maximum code point value read in the file.

### 5.1.3.10 hangul\_syllable()

```

void hangul_syllable (
    int choseong,
    int jungseong,
    int jongseong,
    unsigned char hangul_base[][32],
    unsigned char * syllable )

```

Given letters in a Hangul syllable, return a glyph.

This function returns a glyph bitmap comprising up to three Hangul letters that form a syllable. It reads the three component letters (choseong, jungseong, and jongseong), then calls a function that determines the appropriate variation of each letter, returning the letter bitmap locations in the glyph array. Then these letter bitmaps are combined with a logical OR operation to produce a final bitmap, which forms a 16 row by 16 column bitmap glyph.

## Parameters

in	choseong	The 1st letter in the composite glyph.
in	jungseong	The 2nd letter in the composite glyph.
in	jongseong	The 3rd letter in the composite glyph.
in	hangul_base	The glyphs read from the "hangul_base.hex" file.

## Returns

syllable The composite syllable, as a 16 by 16 pixel bitmap.

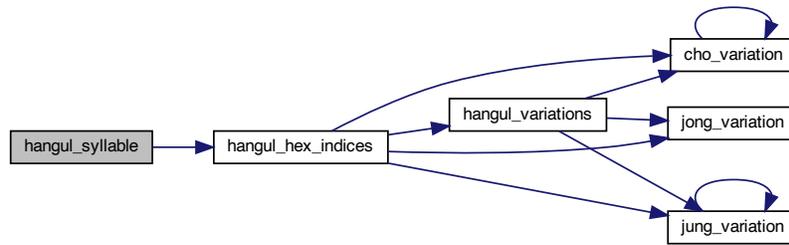

Definition at line 583 of file [unihangul-support.c](#).

```

00584                                     {
00585
00586     int    i; /* loop variable */
00587     int    cho_hex, jung_hex, jong_hex;
00588     unsigned char glyph_byte;
00589
00590
00591     hangul\_hex\_indices (choseong, jungseong, jongseong,
00592                       &cho_hex, &jung_hex, &jong_hex);
00593
00594     for (i = 0; i < 32; i++) {
00595         glyph_byte = hangul_base [cho_hex][i];
00596         glyph_byte |= hangul_base [jung_hex][i];
00597         if (jong_hex >= 0) glyph_byte |= hangul_base [jong_hex][i];
00598         syllable[i] = glyph_byte;
00599     }
00600
00601     return;
00602 }

```

Here is the call graph for this function:

Here is the caller graph for this function:

### 5.1.3.11 hangul\_variations()

```

void hangul_variations (
    int choseong,
    int jungseong,
    int jongseong,
    int * cho_var,
    int * jung_var,
    int * jong_var )
  
```

Determine the variations of each letter in a Hangul syllable.

Given the three letters that will form a syllable, return the variation of each letter used to form the composite glyph.

This function can determine variations for both modern and archaic Hangul letters; it is not limited to only the letters combinations that comprise the Unicode Hangul Syllables range.

This function reads these input values for modern and ancient Hangul letters:

- Choseong number (0 to the number of modern and archaic choseong - 1).
- Jungseong number (0 to the number of modern and archaic jungseong - 1).
- Jongseong number (0 to the number of modern and archaic jongseong - 1, or -1 if none).

It then determines the variation of each letter given the combination with the other two letters (or just choseong and jungseong if the jongseong value is -1).

## Parameters

in	choseong	The 1st letter in the syllable.
in	jungseong	The 2nd letter in the syllable.
in	jongseong	The 3rd letter in the syllable, or -1 if none.
out	cho_var	Variation of the 1st letter from the hangul-base.hex file.
out	jung_var	Variation of the 2nd letter from the hangul-base.hex file.
out	jong_var	Variation of the 3rd letter from the hangul-base.hex file.

### 5.1.3.13 jong\_variation()

```

int jong_variation (
    int choseong,
    int jungseong,
    int jongseong ) [inline]

```

Return the Johab 6/3/1 jongseong variation.

There is only one jongseong variation, so this function always returns 0. It is a placeholder function for possible future adaptation to other johab encodings.

Parameters

in	choseong	The 1st letter in the syllable.
in	jungseong	The 2nd letter in the syllable.
in	jongseong	The 3rd letter in the syllable.

## Returns

The jongseong variation, always 0.

Definition at line 558 of file [unihangul-support.c](#).

```
00558     {
00559
00560     return 0; /* There is only one Jongseong variation. */
00561 }
```

Here is the caller graph for this function:

## 5.1.3.14 jung\_variation()

```
int jung_variation (
    int choseong,
    int jungseong,
    int jongseong ) [inline]
```

Return the Johab 6/3/1 jungseong variation.

This function takes the two or three (if jongseong is included) letters that comprise a syllable and determine the variation of the vowel (jungseong).

Each jungseong has 3 variations:

Variation Occurrence

0 Jungseong with only chungseong (no jungseong). 1 Jungseong with chungseong and jungseong (except nieun). 2 Jungseong with chungseong and jungseong nieun.

## Parameters

in	choseong	The 1st letter in the syllable.
in	jungseong	The 2nd letter in the syllable.
in	jongseong	The 3rd letter in the syllable.

## Returns

The jungseong variation, 0 to 2.

Definition at line 524 of file [unihangul-support.c](#).

```

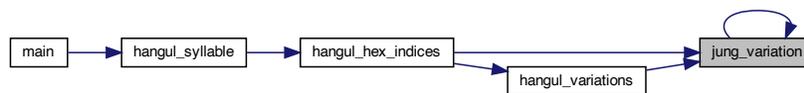

00524     {
00525     int jung_variation; /* Return value */

```

void one_jamo (
    unsigned glyph_table[MAX_GLYPHS][16],
    unsigned jamo,
    unsigned * jamo_glyph )

```

Convert Hangul Jamo choseong, jungseong, and jongseong into a glyph.

## Parameters

in	glyph_table	The collection of all jamo glyphs.
in	jamo	The Unicode code point, 0 or 0x1100..0x115F.
out	jamo_glyph	The output glyph, 16 columns in each of 16 rows.

Definition at line 717 of file [unihangul-support.c](#).

00743 }

```

### 5.1.3.16 print\_glyph\_hex()

```

void print_glyph_hex (
    FILE * fp,
    unsigned codept,
    unsigned * this_glyph )

```

Print one glyph in Unifont hexdraw hexadecimal string style.

## Parameters

in	fp	The file pointer for output.
in	codept	The Unicode code point to print with the glyph.
in	this_glyph	The 16-row by 16-column glyph to print.

Definition at line 692 of file [unihangul-support.c](#).

```

00692                                     {
00693
00694     int i;
00695
00696     fprintf (fp, "%04X:", codept);
00697
00698     /* for each this_glyph row */
00699     for (i = 0; i < 16; i++) {
00700         fprintf (fp, "%04X", this_glyph[i]);
00701     }
00702     fputc ('\n', fp);
00703
00704     return;
00705 }
00706 }

```

Here is the caller graph for this function:

## 5.1.3.17 print\_glyph\_txt()

```
void print_glyph_txt (
    FILE * fp,
    unsigned codept,
    unsigned * this_glyph )
```

Print one glyph in Unifont hexdraw plain text style.

## Parameters

in	fp	The file pointer for output.
in	codept	The Unicode code point to print with the glyph.
in	this_glyph	The 16-row by 16-column glyph to print.

Definition at line 656 of file [unihangul-support.c](#).

```
00656                                     {
00657     int i;
00658     unsigned mask;
00659
00660     fprintf (fp, "%04X:", codept);
00661
00662     /* for each this_glyph row */
00663     for (i = 0; i < 16; i++) {
00664         mask = 0x8000;
00665         fputc ('\t', fp);
00666         while (mask != 0x0000) {
00667             if (mask & this_glyph [i]) {
00668                 fputc ('#', fp);
00669             }
00670             else {
00671                 fputc ('.', fp);
00672             }
00673             mask »= 1; /* shift to next bit in this_glyph row */
00674         }
00675         fputc ('\n', fp);
00676     }
00677     fputc ('\n', fp);
00678     return;
00679 }
00680 }
00681 }
```

hex2otf - Convert GNU Unifont .hex file to OpenType font

```

#include <assert.h>
#include <ctype.h>
#include <inttypes.h>
#include <stdarg.h>
#include <stdbool.h>
#include <stddef.h>
#include <stdio.h>
#include <stdlib.h>
#include <string.h>
#include "hex2otf.h"

```

Include dependency graph for hex2otf.c:

## Data Structures

- struct [Buffer](#)  
Generic data structure for a linked list of buffer elements.
- struct [Glyph](#)  
Data structure to hold data for one bitmap glyph.
- struct [Font](#)  
Data structure to hold information for one font.
- struct [Table](#)  
Data structure for an OpenType table.
- struct [TableRecord](#)  
Data structure for data associated with one OpenType table.
- struct [Options](#)  
Data structure to hold options for OpenType font output.

## Macros

- `#define VERSION "1.0.1"`  
Program version, for "--version" option.
- `#define U16MAX 0xffff`  
Maximum UTF-16 code point value.
- `#define U32MAX 0xffffffff`  
Maximum UTF-32 code point value.
- `#define PRI\_CP "U+%.4"PRIxFAST32`  
Format string to print Unicode code point.
- `#define static\_assert(a, b) (assert(a))`  
If "a" is true, return string "b".
- `#define BX(shift, x) ((uintmax_t)(!(x)) << (shift))`  
Truncate & shift word.
- `#define B0(shift) BX((shift), 0)`  
Clear a given bit in a word.
- `#define B1(shift) BX((shift), 1)`  
Set a given bit in a word.
- `#define GLYPH\_MAX\_WIDTH 16`  
Maximum glyph width, in pixels.
- `#define GLYPH\_HEIGHT 16`  
Maximum glyph height, in pixels.
- `#define GLYPH\_MAX\_BYTE\_COUNT (GLYPH\_HEIGHT * GLYPH\_MAX\_WIDTH / 8)`  
Number of bytes to represent one bitmap glyph as a binary array.
- `#define DESCENDER 2`  
Count of pixels below baseline.
- `#define ASCENDER (GLYPH\_HEIGHT - DESCENDER)`  
Count of pixels above baseline.
- `#define FUPEM 64`  
[Font](#) units per em.
- `#define MAX\_GLYPHS 65536`  
An OpenType font has at most 65536 glyphs.
- `#define MAX\_NAME\_IDS 256`

- Name IDs 0-255 are used for standard names.
- #define [FU\(x\)](#) ((x) \* [FUPEM](#) / [GLYPH\\_HEIGHT](#))  
Convert pixels to font units.
- #define [PW\(x\)](#) ((x) / ([GLYPH\\_HEIGHT](#) / 8))  
Convert glyph byte count to pixel width.
- #define [defineStore](#)(name, type)  
Temporary define to look up an element in an array of given type.
- #define [addByte](#)(shift)
- #define [getRowBit](#)(rows, x, y) ((rows)[(y)] & x0 >> (x))
- #define [flipRowBit](#)(rows, x, y) ((rows)[(y)] ^ x0 >> (x))
- #define [stringCount](#) (sizeof strings / sizeof \*strings)
- #define [cacheCFF32](#)(buf, x) ([cacheU8](#) ((buf), 29), [cacheU32](#) ((buf), (x)))

## Typedefs

- typedef unsigned char [byte](#)  
Definition of "byte" type as an unsigned char.
- typedef int\_least8\_t [pixels\\_t](#)  
This type must be able to represent max([GLYPH\\_MAX\\_WIDTH](#), [GLYPH\\_HEIGHT](#)).
- typedef struct [Buffer](#) [Buffer](#)  
Generic data structure for a linked list of buffer elements.
- typedef const char \* [NameStrings](#)[[MAX\\_NAME\\_IDS](#)]  
Array of OpenType names indexed directly by Name IDs.
- typedef struct [Glyph](#) [Glyph](#)  
Data structure to hold data for one bitmap glyph.
- typedef struct [Font](#) [Font](#)  
Data structure to hold information for one font.
- typedef struct [Table](#) [Table](#)  
Data structure for an OpenType table.
- typedef struct [Options](#) [Options](#)  
Data structure to hold options for OpenType font output.

## Enumerations

- enum [LocaFormat](#) { [LOCA\\_OFFSET16](#) = 0 , [LOCA\\_OFFSET32](#) = 1 }
  - enum [ContourOp](#) { [OP\\_CLOSE](#) , [OP\\_POINT](#) }
  - enum [FillSide](#) { [FILL\\_LEFT](#) , [FILL\\_RIGHT](#) }
- Fill to the left side (CFF) or right side (TrueType) of a contour.

## Functions

- void [fail](#) (const char \*reason,...)  
Print an error message on stderr, then exit.
- void [initBuffers](#) (size\_t count)  
Initialize an array of buffer pointers to all zeroes.
- void [cleanBuffers](#) ()  
Free all allocated buffer pointers.

- `Buffer * newBuffer (size_t initialCapacity)`  
Create a new buffer.
- `void ensureBuffer (Buffer *buf, size_t needed)`  
Ensure that the buffer has at least the specified minimum size.
- `void freeBuffer (Buffer *buf)`  
Free the memory previously allocated for a buffer.
- `defineStore (storeU8, uint_least8_t)`
- `void cacheU8 (Buffer *buf, uint_fast8_t value)`  
Append one unsigned byte to the end of a byte array.
- `void cacheU16 (Buffer *buf, uint_fast16_t value)`  
Append two unsigned bytes to the end of a byte array.
- `void cacheU32 (Buffer *buf, uint_fast32_t value)`  
Append four unsigned bytes to the end of a byte array.
- `void cacheCFFOperand (Buffer *buf, int_fast32_t value)`  
Cache charstring number encoding in a CFF buffer.
- `void cacheZeros (Buffer *buf, size_t count)`  
Append 1 to 4 bytes of zeroes to a buffer, for padding.
- `void cacheBytes (Buffer *restrict buf, const void *restrict src, size_t count)`  
Append a string of bytes to a buffer.
- `void cacheBuffer (Buffer *restrict bufDest, const Buffer *restrict bufSrc)`  
Append bytes of a table to a byte buffer.
- `void writeBytes (const byte bytes[], size_t count, FILE *file)`  
Write an array of bytes to an output file.
- `void writeU16 (uint_fast16_t value, FILE *file)`  
Write an unsigned 16-bit value to an output file.
- `void writeU32 (uint_fast32_t value, FILE *file)`  
Write an unsigned 32-bit value to an output file.
- `void addTable (Font *font, const char tag[static 4], Buffer *content)`  
Add a TrueType or OpenType table to the font.
- `void organizeTables (Font *font, bool isCFF)`  
Sort tables according to OpenType recommendations.
- `int byTableTag (const void *a, const void *b)`  
Compare tables by 4-byte unsigned table tag value.
- `void writeFont (Font *font, bool isCFF, const char *fileName)`  
Write OpenType font to output file.
- `bool readCodePoint (uint_fast32_t *codePoint, const char *fileName, FILE *file)`  
Read up to 6 hexadecimal digits and a colon from file.
- `void readGlyphs (Font *font, const char *fileName)`  
Read glyph definitions from a Unifont .hex format file.
- `int byCodePoint (const void *a, const void *b)`  
Compare two Unicode code points to determine which is greater.
- `void positionGlyphs (Font *font, const char *fileName, pixels_t *xMin)`  
Position a glyph within a 16-by-16 pixel bounding box.
- `void sortGlyphs (Font *font)`  
Sort the glyphs in a font by Unicode code point.
- `void buildOutline (Buffer *result, const byte bitmap[], const size_t byteCount, const enum FillSide fillSide)`

- Build a glyph outline.
- void [prepareOffsets](#) ([size\\_t](#) \*sizes)
  - Prepare 32-bit glyph offsets in a font table.
- [Buffer](#) \* [prepareStringIndex](#) (const [NameStrings](#) names)
  - Prepare a font name string index.
- void [fillCFF](#) ([Font](#) \*font, int version, const [NameStrings](#) names)
  - Add a CFF table to a font.
- void [fillTrueType](#) ([Font](#) \*font, enum [LocaFormat](#) \*format, [uint\\_fast16\\_t](#) \*maxPoints, [uint\\_fast16\\_t](#) \*maxContours)
  - Add a TrueType table to a font.
- void [fillBlankOutline](#) ([Font](#) \*font)
  - Create a dummy blank outline in a font table.
- void [fillBitmap](#) ([Font](#) \*font)
  - Fill OpenType bitmap data and location tables.
- void [fillHeadTable](#) ([Font](#) \*font, enum [LocaFormat](#) locaFormat, [pixels\\_t](#) xMin)
  - Fill a "head" font table.
- void [fillHheaTable](#) ([Font](#) \*font, [pixels\\_t](#) xMin)
  - Fill a "hhea" font table.
- void [fillMaxpTable](#) ([Font](#) \*font, bool isCFF, [uint\\_fast16\\_t](#) maxPoints, [uint\\_fast16\\_t](#) maxContours)
  - Fill a "maxp" font table.
- void [fillOS2Table](#) ([Font](#) \*font)
  - Fill an "OS/2" font table.
- void [fillHmtxTable](#) ([Font](#) \*font)
  - Fill an "hmtx" font table.
- void [fillCmapTable](#) ([Font](#) \*font)
  - Fill a "cmap" font table.
- void [fillPostTable](#) ([Font](#) \*font)
  - Fill a "post" font table.
- void [fillGposTable](#) ([Font](#) \*font)
  - Fill a "GPOS" font table.
- void [fillGsubTable](#) ([Font](#) \*font)
  - Fill a "GSUB" font table.
- void [cacheStringAsUTF16BE](#) ([Buffer](#) \*buf, const char \*str)
  - Cache a string as a big-ending UTF-16 surrogate pair.
- void [fillNameTable](#) ([Font](#) \*font, [NameStrings](#) nameStrings)
  - Fill a "name" font table.
- void [printVersion](#) ()
  - Print program version string on stdout.
- void [printHelp](#) ()
  - Print help message to stdout and then exit.
- const char \* [matchToken](#) (const char \*operand, const char \*key, char delimiter)
  - Match a command line option with its key for enabling.
- [Options](#) [parseOptions](#) (char \*const argv[const])
  - Parse command line options.
- int [main](#) (int argc, char \*argv[])
  - The main function.

## Variables

- [Buffer \\* allBuffers](#)  
Initial allocation of empty array of buffer pointers.
- `size_t` [bufferCount](#)  
Number of buffers in a [Buffer \\* array](#).
- `size_t` [nextBufferIndex](#)  
Index number to tail element of [Buffer \\* array](#).

### 5.3.1 Detailed Description

hex2otf - Convert GNU Unifont .hex file to OpenType font

This program reads a Unifont .hex format file and a file containing combining mark offset information, and produces an OpenType font file.

### 5.3.2 Macro Definition Documentation

#### 5.3.2.1 addByte

```
#define addByte(  
    shift )
```

Value:

```
if (p == end) \  
    break; \  
record->checksum += (uint_fast32_t)*p++ « (shift);
```

#### 5.3.2.2 ASCENDER

```
#define ASCENDER (GLYPH_HEIGHT - DESCENDER)
```

Count of pixels above baseline.

Definition at line 79 of file [hex2otf.c](#).

#### 5.3.2.3 B0

```
#define B0(  
    shift ) BX((shift), 0)
```

Clear a given bit in a word.

Definition at line 66 of file [hex2otf.c](#).

## 5.3.2.4 B1

```
#define B1(
    shift ) BX((shift), 1)
```

Set a given bit in a word.

Definition at line 67 of file [hex2otf.c](#).

## 5.3.2.5 BX

```
#define BX(
    shift,
    x ) ((uintmax_t)(!(x)) << (shift))
```

Truncate & shift word.

Definition at line 65 of file [hex2otf.c](#).

## 5.3.2.6 defineStore

```
#define defineStore(
    name,
    type )
```

Value:

```
void name (Buffer *buf, type value) \
{ \
    type *slot = getBufferSlot (buf, sizeof value); \
    *slot = value; \
}
```

Temporary define to look up an element in an array of given type.

This definition is used to create lookup functions to return a given element in unsigned arrays of size 8, 16, and 32 bytes, and in an array of pixels.

Definition at line 350 of file [hex2otf.c](#).

## 5.3.2.7 DESCENDER

```
#define DESCENDER 2
```

Count of pixels below baseline.

Definition at line 76 of file [hex2otf.c](#).

## 5.3.2.8 FU

```
#define FU(
    x ) ((x) * FUPEM / GLYPH_HEIGHT)
```

Convert pixels to font units.

Definition at line 91 of file [hex2otf.c](#).

## 5.3.2.9 FUPEM

```
#define FUPEM 64
```

Font units per em.

Definition at line 82 of file [hex2otf.c](#).

### 5.3.2.10 GLYPH\_HEIGHT

```
#define GLYPH_HEIGHT 16
```

Maximum glyph height, in pixels.  
Definition at line 70 of file [hex2otf.c](#).

### 5.3.2.11 GLYPH\_MAX\_BYTE\_COUNT

```
#define GLYPH_MAX_BYTE_COUNT (GLYPH_HEIGHT * GLYPH_MAX_WIDTH / 8)
```

Number of bytes to represent one bitmap glyph as a binary array.  
Definition at line 73 of file [hex2otf.c](#).

### 5.3.2.12 GLYPH\_MAX\_WIDTH

```
#define GLYPH_MAX_WIDTH 16
```

Maximum glyph width, in pixels.  
Definition at line 69 of file [hex2otf.c](#).

### 5.3.2.13 MAX\_GLYPHS

```
#define MAX_GLYPHS 65536
```

An OpenType font has at most 65536 glyphs.  
Definition at line 85 of file [hex2otf.c](#).

### 5.3.2.14 MAX\_NAME\_IDS

```
#define MAX_NAME_IDS 256
```

Name IDs 0-255 are used for standard names.  
Definition at line 88 of file [hex2otf.c](#).

### 5.3.2.15 PRI\_CP

```
#define PRI_CP "U+%.4"PRIFAST32
```

Format string to print Unicode code point.  
Definition at line 58 of file [hex2otf.c](#).

### 5.3.2.16 PW

```
#define PW(  
    x ) ((x) / (GLYPH_HEIGHT / 8))
```

Convert glyph byte count to pixel width.  
Definition at line 94 of file [hex2otf.c](#).

### 5.3.2.17 static\_assert

```
#define static_assert(  
    a,  
    b ) (assert(a))
```

If "a" is true, return string "b".  
Definition at line 61 of file [hex2otf.c](#).

#### 5.3.2.18 U16MAX

```
#define U16MAX 0xffff
```

Maximum UTF-16 code point value.  
Definition at line [55](#) of file [hex2otf.c](#).

#### 5.3.2.19 U32MAX

```
#define U32MAX 0xffffffff
```

Maximum UTF-32 code point value.  
Definition at line [56](#) of file [hex2otf.c](#).

#### 5.3.2.20 VERSION

```
#define VERSION "1.0.1"
```

Program version, for "--version" option.  
Definition at line [51](#) of file [hex2otf.c](#).

### 5.3.3 Typedef Documentation

#### 5.3.3.1 Buffer

```
typedef struct Buffer Buffer
```

Generic data structure for a linked list of buffer elements.

A buffer can act as a vector (when filled with 'store\*' functions), or a temporary output area (when filled with 'cache\*' functions). The 'store\*' functions use native endian. The 'cache\*' functions use big endian or other formats in OpenType. Beware of memory alignment.

#### 5.3.3.2 byte

```
typedef unsigned char byte
```

Definition of "byte" type as an unsigned char.  
Definition at line [97](#) of file [hex2otf.c](#).

#### 5.3.3.3 Glyph

```
typedef struct Glyph Glyph
```

Data structure to hold data for one bitmap glyph.

This data structure holds data to represent one Unifont bitmap glyph: Unicode code point, number of bytes in its bitmap array, whether or not it is a combining character, and an offset from the glyph origin to the start of the bitmap.

#### 5.3.3.4 NameStrings

```
typedef const char* NameStrings[MAX\_NAME\_IDS]
```

Array of OpenType names indexed directly by Name IDs.  
Definition at line [604](#) of file [hex2otf.c](#).

### 5.3.3.5 Options

typedef struct [Options](#) [Options](#)

Data structure to hold options for OpenType font output.

This data structure holds the status of options that can be specified as command line arguments for creating the output OpenType font file.

### 5.3.3.6 pixels\_t

typedef int\_least8\_t [pixels\\_t](#)

This type must be able to represent  $\max(\text{GLYPH\_MAX\_WIDTH}, \text{GLYPH\_HEIGHT})$ .

Definition at line 100 of file [hex2otf.c](#).

### 5.3.3.7 Table

typedef struct [Table](#) [Table](#)

Data structure for an OpenType table.

This data structure contains a table tag and a pointer to the start of the buffer that holds data for this OpenType table.

For information on the OpenType tables and their structure, see <https://docs.microsoft.com/en-us/Typography/opentype/spec/otff#font-tables>.

## 5.3.4 Enumeration Type Documentation

### 5.3.4.1 ContourOp

enum [ContourOp](#)

Specify the current contour drawing operation.

Enumerator

OP_CLOSE	Close the current contour path that was being drawn.
OP_POINT	Add one more (x,y) point to the contour being drawn.

Definition at line 1136 of file [hex2otf.c](#).

```
01136 {
01137     OP_CLOSE,    ///< Close the current contour path that was being drawn.
01138     OP_POINT    ///< Add one more (x,y) point to the contor being drawn.
01139 };
```

#### 5.3.4.2 FillSide

enum [FillSide](#)

Fill to the left side (CFF) or right side (TrueType) of a contour.

Enumerator

FILL_LEFT	Draw out-line counter-clockwise (CFF, PostScript).
FILL_RIGHT	Draw out-line clockwise (TrueType).

Definition at line 1144 of file [hex2otf.c](#).

```
01144 {
01145     FILL_LEFT,    ///< Draw outline counter-clockwise (CFF, PostScript).
01146     FILL_RIGHT    ///< Draw outline clockwise (TrueType).
01147 };
```

#### 5.3.4.3 LocaFormat

enum [LocaFormat](#)

Index to Location ("loca") offset information.

This enumerated type encodes the type of offset to locations in a table. It denotes Offset16 (16-bit) and Offset32 (32-bit) offset types.

Enumerator

LOCA_OFFSET16	Offset to location is a 16-bit Offset16 value.
---------------	--

## Enumerator

LOCA_OFFSET32	Offset to location is a 32-bit Offset32 value.
---------------	--

Definition at line 658 of file hex2otf.c.

```
00658 {
00659     LOCA_OFFSET16 = 0,    ///< Offset to location is a 16-bit Offset16 value
00660     LOCA_OFFSET32 = 1,   ///< Offset to location is a 32-bit Offset32 value
00661 };
```

### 5.3.5 Function Documentation

#### 5.3.5.1 addTable()

```
void addTable (
    Font * font,
    const char tag[static 4],
    Buffer * content )
```

Add a TrueType or OpenType table to the font.

This function adds a TrueType or OpenType table to a font. The 4-byte table tag is passed as an unsigned 32-bit integer in big-endian format.

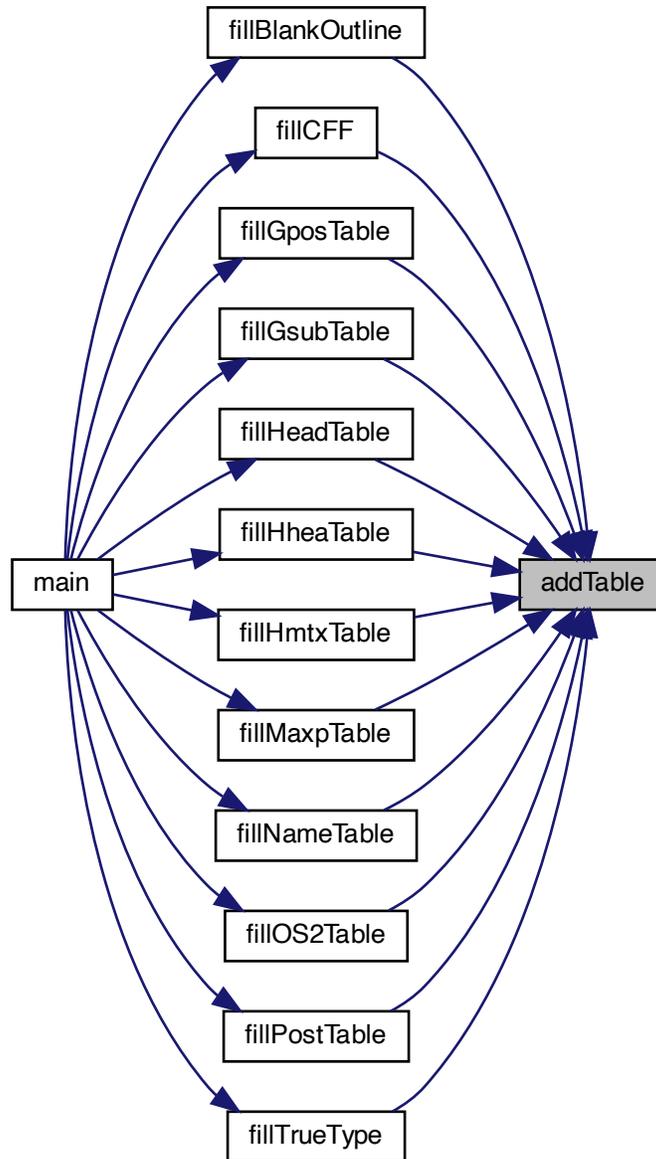

#### Parameters

in,out	font	The font to which a font table will be added.
in	tag	The 4-byte table name.
in	content	The table bytes to add, of type <code>Buffer *</code> .

Definition at line 694 of file [hex2otf.c](#).

```
00695 {  
00696     Table *table = getBufferSlot (font->tables, sizeof (Table));  
00697     table->tag = tagAsU32 (tag);  
00698     table->content = content;  
00699 }
```

Here is the caller graph for this function:

## 5.3.5.2 buildOutline()

```
void buildOutline (
    Buffer * result,
    const byte bitmap[],
    const size_t byteCount,
    const enum FillSide fillSide )
```

Build a glyph outline.

This function builds a glyph outline from a Unifont glyph bitmap.

Parameters

out	result	The resulting glyph outline.
in	bitmap	A bitmap array.
in	byteCount	the number of bytes in the input bitmap array.
in	fillSide	Enumerated indicator to fill left or right side.

Get the value of a given bit that is in a given row.

Invert the value of a given bit that is in a given row.

Definition at line 1160 of file [hex2otf.c](#).

```
01162 {
01163     enum Direction {RIGHT, LEFT, DOWN, UP}; // order is significant
01164
01165     // respective coordinate deltas
01166     const pixels_t dx[] = {1, -1, 0, 0}, dy[] = {0, 0, -1, 1};
01167
01168     assert (byteCount % GLYPH_HEIGHT == 0);
01169     const uint_fast8_t bytesPerRow = byteCount / GLYPH_HEIGHT;
01170     const pixels_t glyphWidth = bytesPerRow * 8;
01171     assert (glyphWidth <= GLYPH_MAX_WIDTH);
01172
01173     #if GLYPH_MAX_WIDTH < 32
01174         typedef uint_fast32_t row_t;
01175     #elif GLYPH_MAX_WIDTH < 64
01176         typedef uint_fast64_t row_t;
01177     #else
01178     #error GLYPH_MAX_WIDTH is too large.
01179     #endif
01180
01181     row_t pixels[GLYPH_HEIGHT + 2] = {0};
01182     for (pixels_t row = GLYPH_HEIGHT; row > 0; row--)
```

```

01267 }

```

### 5.3.5.3 byCodePoint()

```

int byCodePoint (
    const void * a,
    const void * b )

```

Compare two Unicode code points to determine which is greater.

This function compares the Unicode code points contained within two [Glyph](#) data structures. The function returns 1 if the first code point is greater, and -1 if the second is greater.

#### Parameters

in	a	A <a href="#">Glyph</a> data structure containing the first code point.
in	b	A <a href="#">Glyph</a> data structure containing the second code point.

#### Returns

1 if the code point a is greater, -1 if less, 0 if equal.

Definition at line 1040 of file [hex2otf.c](#).

```

01041 {
01042     const Glyph *const ga = a, *const gb = b;
01043     int gt = ga->codePoint > gb->codePoint;
01044     int lt = ga->codePoint < gb->codePoint;
01045     return gt - lt;
01046 }

```

#### 5.3.5.4 byTableTag()

```
int byTableTag (
    const void * a,
    const void * b )
```

Compare tables by 4-byte unsigned table tag value.

This function takes two pointers to a [TableRecord](#) data structure and extracts the four-byte tag structure element for each. The two 32-bit numbers are then compared. If the first tag is greater than the first, then  $gt = 1$  and  $lt = 0$ , and so  $1 - 0 = 1$  is returned. If the first is less than the second, then  $gt = 0$  and  $lt = 1$ , and so  $0 - 1 = -1$  is returned.

Parameters

in	a	Pointer to the first <a href="#">TableRecord</a> structure.
in	b	Pointer to the second <a href="#">TableRecord</a> structure.

Returns

1 if the tag in "a" is greater, -1 if less, 0 if equal.

Definition at line 767 of file [hex2otf.c](#).

```
00768 {
00769     const struct TableRecord *const ra = a, *const rb = b;
00770     int gt = ra->tag > rb->tag;
00771     int lt = ra->tag < rb->tag;
00772     return gt - lt;
00773 }
```

#### 5.3.5.5 cacheBuffer()

```
void cacheBuffer (
    Buffer *restrict bufDest,
    const Buffer *restrict bufSrc )
```

Append bytes of a table to a byte buffer.

## Parameters

in,out	bufDest	The buffer to which the new bytes are appended.
in	bufSrc	The bytes to append to the buffer array.

Definition at line 523 of file [hex2otf.c](#).

```
00524 {
00525     size_t length = countBufferedBytes (bufSrc);
00526     ensureBuffer (bufDest, length);
00527     memcpy (bufDest->next, bufSrc->begin, length);
00528     bufDest->next += length;
00529 }
```

## 5.3.5.6 cacheBytes()

```
void cacheBytes (
    Buffer *restrict buf,
    const void *restrict src,
    size_t count )
```

Append a string of bytes to a buffer.

This function appends an array of 1 to 4 bytes to the end of a buffer.

## Parameters

in,out	buf	The buffer to which the bytes are appended.
--------	-----	---

## Parameters

in	src	The array of bytes to append to the buffer.
in	count	The number of bytes containing zeroes to append.

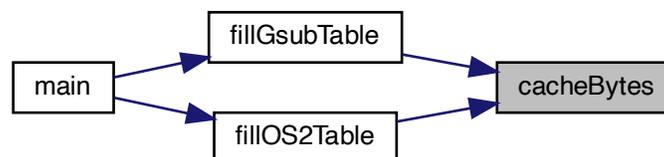

Definition at line 509 of file [hex2otf.c](#).

```
00510 {
00511     ensureBuffer (buf, count);
00512     memcpy (buf->next, src, count);
00513     buf->next += count;
00514 }
```

Here is the caller graph for this function:

## 5.3.5.7 cacheCFFOperand()

```
void cacheCFFOperand (
    Buffer * buf,
    int_fast32_t value )
```

Cache charstring number encoding in a CFF buffer.

This function caches two's complement 8-, 16-, and 32-bit words as per Adobe's Type 2 Charstring encoding for operands. These operands are used in Compact [Font](#) Format data structures.

Byte values can have offsets, for which this function compensates, optionally followed by additional bytes:

Byte Range	Offset	Bytes	Adjusted Range
0 to 11	0	1	0 to 11 (operators)
12	0	2	Next byte is 8-bit op code
13 to 18	0	1	13 to 18 (operators)
19 to 20	0	2+	hintmask and cntrmask operators
21 to 27	0	1	21 to 27 (operators)
28	0	3	16-bit 2's complement number
29 to 31	0	1	29 to 31 (operators)
32 to 246	-139	1	-107 to +107
247 to 250	+108	2	+108 to +1131
251 to 254	-108	2	-108 to -1131
255	0	5	16-bit integer and 16-bit fraction

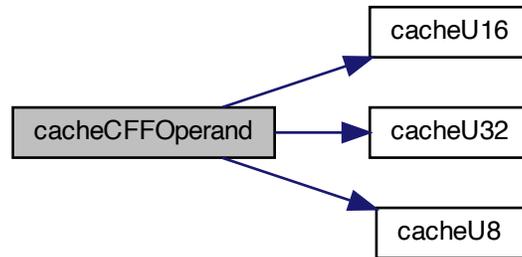

## Parameters

in,out	buf	The buffer to which the operand value is appended.
in	value	The operand value.

Definition at line 460 of file [hex2otf.c](#).

```
00461 {
00462     if (-107 <= value && value <= 107)
00463         cacheU8 (buf, value + 139);
00464     else if (108 <= value && value <= 1131)
00465     {
00466         cacheU8 (buf, (value - 108) / 256 + 247);
00467         cacheU8 (buf, (value - 108) % 256);
00468     }
00469     else if (-32768 <= value && value <= 32767)
00470     {
00471         cacheU8 (buf, 28);
00472         cacheU16 (buf, value);
00473     }
00474     else if (-2147483647 <= value && value <= 2147483647)
00475     {
00476         cacheU8 (buf, 29);
00477         cacheU32 (buf, value);
00478     }
00479     else
00480         assert (false); // other encodings are not used and omitted
00481     static_assert (GLYPH_MAX_WIDTH <= 107, "More encodings are needed.");
00482 }
```

### 5.3.5.8 cacheStringAsUTF16BE()

```
void cacheStringAsUTF16BE (
    Buffer * buf,
    const char * str )
```

Cache a string as a big-ending UTF-16 surrogate pair.

This function encodes a UTF-8 string as a big-endian UTF-16 surrogate pair.

Parameters

in,out	buf	Pointer to a Buffer struct to update.
in	str	The character array to encode.

Definition at line 2316 of file [hex2otf.c](#).

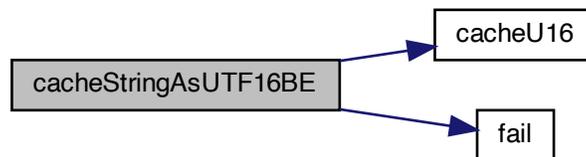

```
02317 {
02318     for (const char *p = str; *p; p++)
02319     {
02320         byte c = *p;
02321         if (c < 0x80)
02322         {
02323             cacheU16 (buf, c);
02324             continue;
02325         }
02326         int length = 1;
02327         byte mask = 0x40;
02328         for (; c & mask; mask »= 1)
02329             length++;
02330         if (length == 1 || length > 4)
02331             fail ("Ill-formed UTF-8 sequence.");
```

```

02332     uint_fast32_t codePoint = c & (mask - 1);
02333     for (int i = 1; i < length; i++)
02334     {
02335         c = *++p;
02336         if ((c & 0xc0) != 0x80) // NUL checked here
02337             fail ("Ill-formed UTF-8 sequence.");

### 5.3.5.9 cacheU16()

```

void cacheU16 (
    Buffer * buf,
    uint_fast16_t value )

```

Append two unsigned bytes to the end of a byte array.

This function adds two bytes to the end of a byte array. The buffer is updated to account for the newly-added bytes.

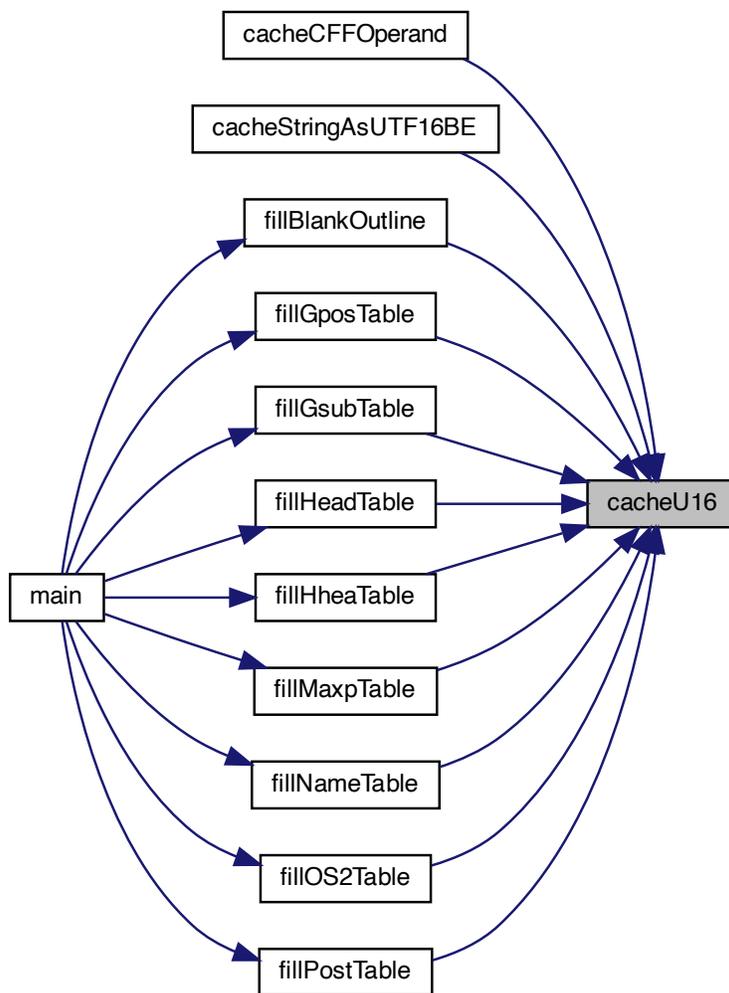

## Parameters

in,out	buf	The array of bytes to which to append two new bytes.
in	value	The 16-bit unsigned value to append to the buf array.

Definition at line 412 of file [hex2otf.c](#).

```
00413 {  
00414     cacheU (buf, value, 2);  
00415 }
```

#### 5.3.5.10 `cacheU32()`

```
void cacheU32 (
    Buffer * buf,
    uint_fast32_t value )
```

Append four unsigned bytes to the end of a byte array.

This function adds four bytes to the end of a byte array. The buffer is updated to account for the newly-added bytes.

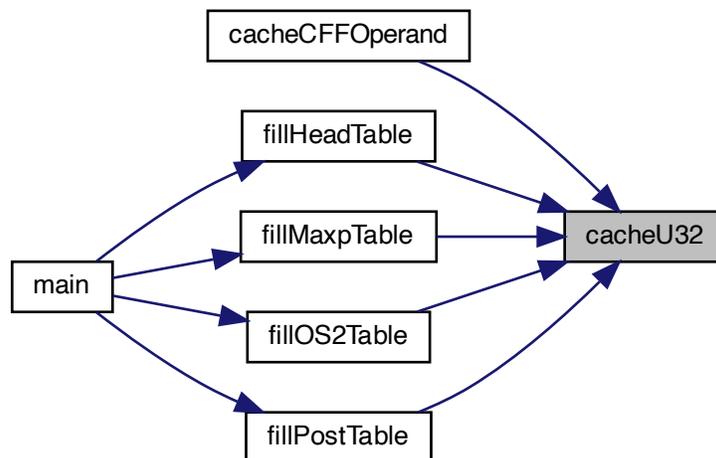

## Parameters

in,out	buf	The array of bytes to which to append four new bytes.
in	value	The 32-bit unsigned value to append to the buf array.

Definition at line [427](#) of file [hex2otf.c](#).

```
00428 {
00429     cacheU (buf, value, 4);
00430 }
```

Here is the caller graph for this function:

## 5.3.5.11 cacheU8()

```
void cacheU8 (
    Buffer * buf,
    uint_fast8_t value )
```

Append one unsigned byte to the end of a byte array.

This function adds one byte to the end of a byte array. The buffer is updated to account for the newly-added byte.

## Parameters

in,out	buf	The array of bytes to which to append a new byte.
in	value	The 8-bit unsigned value to append to the buf array.

Definition at line 397 of file [hex2otf.c](#).

```
00398 {
00399     storeU8 (buf, value & 0xff);
00400 }
```

Here is the caller graph for this function:

## 5.3.5.12 cacheZeros()

```
void cacheZeros (
    Buffer * buf,
    size_t count )
```

Append 1 to 4 bytes of zeroes to a buffer, for padding.

Parameters

in,out	buf	The buffer to which the operand value is appended.
in	count	The number of bytes containing zeroes to append.

Definition at line 491 of file [hex2otf.c](#).

```
00492 {
00493     ensureBuffer (buf, count);
00494     memset (buf->next, 0, count);
00495     buf->next += count;
00496 }
```

Here is the call graph for this function:

Here is the caller graph for this function:

## 5.3.5.13 cleanBuffers()

```
void cleanBuffers ( )
```

Free all allocated buffer pointers.

This function frees all buffer pointers previously allocated in the `initBuffers` function.

Definition at line 170 of file `hex2otf.c`.

```
00171 {
00172     for (size_t i = 0; i < bufferCount; i++)
00173         if (allBuffers[i].capacity)
00174             free (allBuffers[i].begin);
00175     free (allBuffers);
00176     bufferCount = 0;
00177 }
```

Here is the caller graph for this function:

## 5.3.5.14 defineStore()

```
defineStore (
    storeU8 ,
    uint_least8_t )
```

Definition at line 356 of file `hex2otf.c`.

```
00375 {
00376     assert (1 <= bytes && bytes <= 4);
00377     ensureBuffer (buf, bytes);
00378     switch (bytes)
00379     {
00380     case 4: *buf->next++ = value » 24 & 0xff; // fall through
00381     case 3: *buf->next++ = value » 16 & 0xff; // fall through
00382     case 2: *buf->next++ = value » 8  & 0xff; // fall through
00383     case 1: *buf->next++ = value      & 0xff;
00384     }
00385 }
```

## 5.3.5.15 ensureBuffer()

```
void ensureBuffer (
    Buffer * buf,
    size_t needed )
```

Ensure that the buffer has at least the specified minimum size.

This function takes a buffer array of type `Buffer` and the necessary minimum number of elements as inputs, and attempts to increase the size of the buffer if it must be larger.

If the buffer is too small and cannot be resized, the program will terminate with an error message and an exit status of `EXIT_FAILURE`.

## Parameters

in,out	buf	The buffer to check.
in	needed	The required minimum number of elements in the buffer.

Definition at line 239 of file `hex2otf.c`.

```

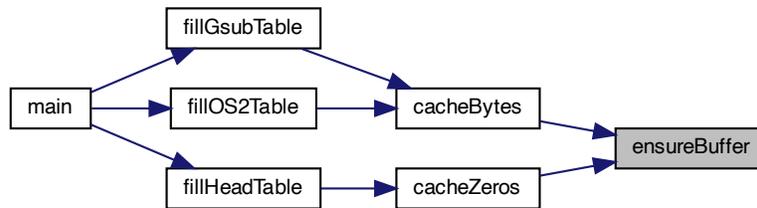

00240 {
00241     if (buf->end - buf->next >= needed)
00242         return;
00243     ptrdiff_t occupied = buf->next - buf->begin;
00244     size_t required = occupied + needed;
00245     if (required < needed) // overflow
00246         fail ("Cannot allocate %zu + %zu bytes of memory.", occupied, needed);
00247     if (required > SIZE_MAX / 2)
00248         buf->capacity = required;
00249     else while (buf->capacity < required)
00250         buf->capacity *= 2;
00251     void *extended = realloc (buf->begin, buf->capacity);
00252     if (!extended)
00253         fail ("Failed to allocate %zu bytes of memory.", buf->capacity);
00254     buf->begin = extended;
00255     buf->next = buf->begin + occupied;
00256     buf->end = buf->begin + buf->capacity;
00257 }

```

### 5.3.5.16 fail()

```
void fail (
    const char * reason,
    ... )
```

Print an error message on stderr, then exit.

This function prints the provided error string and optional following arguments to stderr, and then exits with a status of EXIT\_FAILURE.

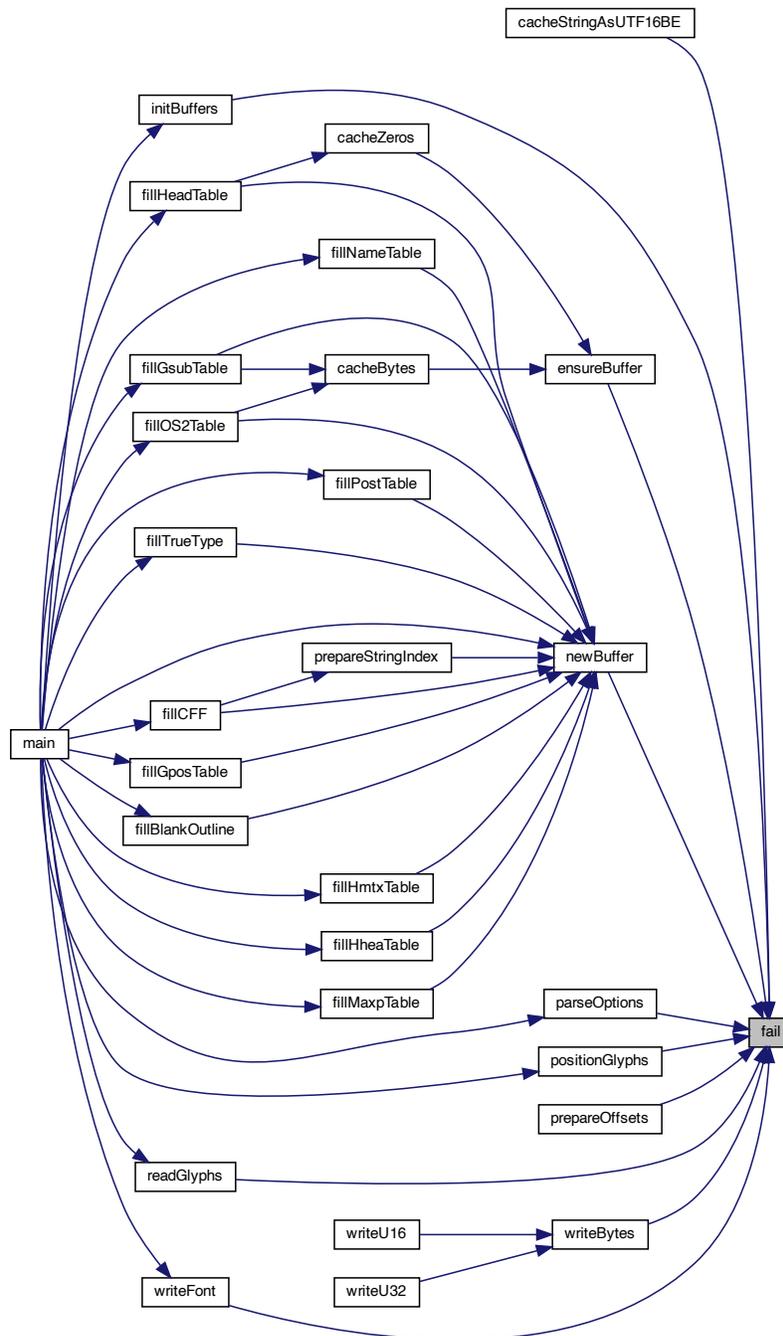

Parameters

in	reason	The output string to describe the error.
in	...	Optional following arguments to output.

Definition at line 113 of file [hex2otf.c](#).

```
00114 {
00115     fputs("ERROR: ", stderr);
00116     va_list args;
00117     va_start(args, reason);
00118     vfprintf(stderr, reason, args);
00119     va_end(args);
00120     putc('\n', stderr);
00121     exit(EXIT_FAILURE);
00122 }
```

Here is the caller graph for this function:

### 5.3.5.17 fillBitmap()

```
void fillBitmap (
```

Font \* font )

Fill OpenType bitmap data and location tables.

This function fills an Embedded Bitmap Data (EBDT) [Table](#) and an Embedded Bitmap Location (EBLC) [Table](#) with glyph bitmap information. These tables enable embedding bitmaps in OpenType fonts. No Embedded Bitmap Scaling (EBSC) table is used for the bitmap glyphs, only EBDT and EBLC.

Parameters

in,out	font	Pointer to a <a href="#">Font</a> struct in which to add bitmaps.
--------	------	---

Definition at line 1728 of file [hex2otf.c](#).

```

1729 {
1730     const Glyph *const glyphs = getBufferHead (font->glyphs);
1731     const Glyph *const glyphsEnd = getBufferTail (font->glyphs);

### 5.3.5.20 fillCmapTable()

```

void fillCmapTable (
    Font * font )

```

Fill a "cmap" font table.

The "cmap" table contains character to glyph index mapping information.

Parameters

in,out	font	The <a href="#">Font</a> struct to which to add the table.
--------	------	--

Definition at line [2109](#) of file [hex2otf.c](#).

```

02110 {
02111     Glyph *const glyphs = getBufferHead (font->glyphs);
02112     Buffer *rangeHeads = newBuffer (16);
02113     uint_fast32_t rangeCount = 0;

```

```

### 5.3.5.21 fillGposTable()

```

void fillGposTable (
    Font * font )

```

Fill a "GPOS" font table.

The "GPOS" table contains information for glyph positioning.

Parameters

in,out	font	The <b>Font</b> struct to which to add the table.
--------	------	---

Definition at line 2241 of file [hex2otf.c](#).

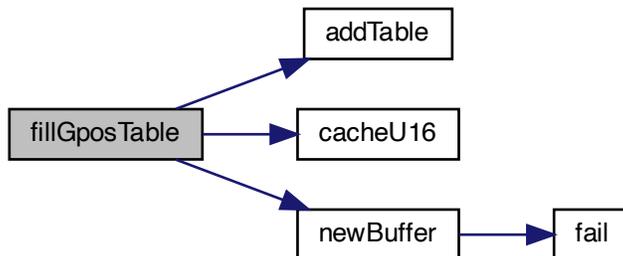

```

02242 {
02243     Buffer *gpos = newBuffer (16);
02244     addTable (font, "GPOS", gpos);
02245     cacheU16 (gpos, 1); // majorVersion
02246     cacheU16 (gpos, 0); // minorVersion
02247     cacheU16 (gpos, 10); // scriptListOffset

#### 5.3.5.24 fillHheaTable()

```
void fillHheaTable (
```

```

    Font * font,
    pixels_t xMin )

```

Fill a "hhea" font table.

The "hhea" table contains horizontal header information, for example left and right side bearings.

Parameters

in,out	font	The <code>Font</code> struct to which to add the table.
in	xMin	The minimum x-coordinate for a glyph.

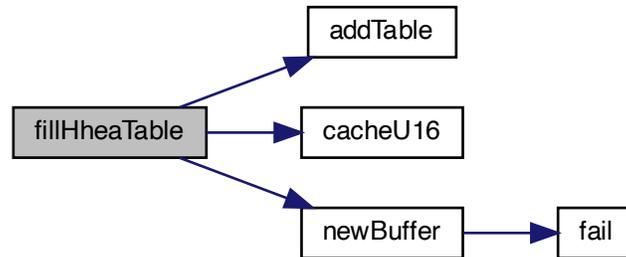

Definition at line 1918 of file `hex2otf.c`.

```

01919 {
01920     Buffer *hhea = newBuffer (36);
01921     addTable (font, "hhea", hhea);

### 5.3.5.25 fillHmtxTable()

```
void fillHmtxTable (
```

```
    Font * font )
```

Fill an "hmtx" font table.

The "hmtx" table contains horizontal metrics information.

Parameters

in,out	font	The <a href="#">Font</a> struct to which to add the table.
--------	------	--

Definition at line [2087](#) of file [hex2otf.c](#).

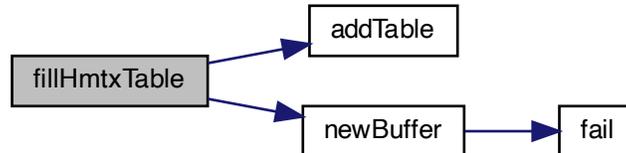

```
02088 {
02089     Buffer *hmtx = newBuffer (4 * font->glyphCount);
02090     addTable (font, "hmtx", hmtx);
02091     const Glyph *const glyphs = getBufferHead (font->glyphs);
```

```

02092  const Glyph *const glyphsEnd = getBufferTail (font->glyphs);
02093  for (const Glyph *glyph = glyphs; glyph < glyphsEnd; glyph++)
02094  {

### 5.3.5.26 fillMaxpTable()

```

void fillMaxpTable (
    Font * font,
    bool isCFF,
    uint_fast16_t maxPoints,
    uint_fast16_t maxContours )

```

Fill a "maxp" font table.

The "maxp" table contains maximum profile information, such as the memory required to contain the font.

Parameters

in,out	font	The <a href="#">Font</a> struct to which to add the table.
--------	------	--

## Parameters

in	isCFF	true if a CFF font is included, false otherwise.
in	maxPoints	Maximum points in a non-composite glyph.
in	maxContours	Maximum contours in a non-composite glyph.

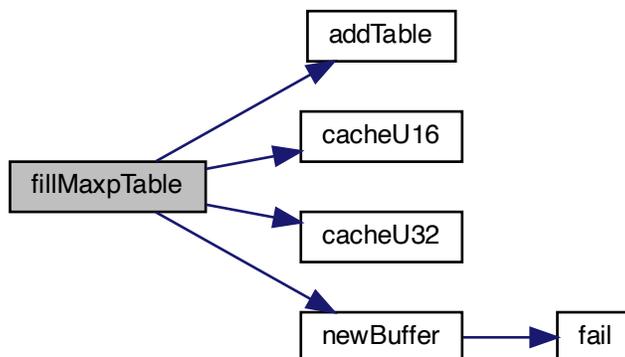

Definition at line 1954 of file [hex2otf.c](#).

```

01956 {
01957     Buffer *maxp = newBuffer (32);
01958     addTable (font, "maxp", maxp);

### 5.3.5.29 fillPostTable()

```
void fillPostTable (
    Font * font )
```

Fill a "post" font table.

The "post" table contains information for PostScript printers.

Parameters

in,out	font	The <a href="#">Font</a> struct to which to add the table.
--------	------	--

Definition at line [2218](#) of file [hex2otf.c](#).

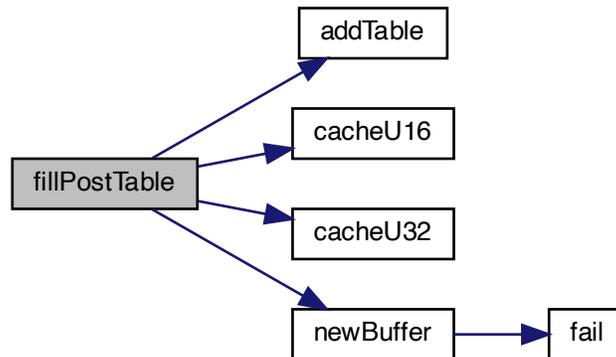

```
02219 {
02220     Buffer *post = newBuffer (32);
```

```

02221  addTable (font, "post", post);

### 5.3.5.30 fillTrueType()

```

void fillTrueType (
    Font * font,
    enum LocaFormat * format,
    uint_fast16_t * maxPoints,
    uint_fast16_t * maxContours )

```

Add a TrueType table to a font.

## Parameters

in,out	font	Pointer to a <a href="#">Font</a> struct to contain the TrueType table.
in	format	The TrueType "loca" table format, Offset16 or Offset32.
in	names	List of NameStrings.

Definition at line 1597 of file [hex2otf.c](#).

#### 5.3.5.31 freeBuffer()

```
void freeBuffer (  
    Buffer * buf )
```

Free the memory previously allocated for a buffer.

This function frees the memory allocated to an array of type `Buffer *`.

Parameters

in	buf	The pointer to an array of type <code>Buffer *</code> .
----	-----	---

Definition at line 337 of file `hex2otf.c`.

```
00338 {  
00339     free (buf->begin);  
00340     buf->capacity = 0;  
00341 }
```

#### 5.3.5.32 initBuffers()

```
void initBuffers (  
    size_t count )
```

Initialize an array of buffer pointers to all zeroes.

This function initializes the "allBuffers" array of buffer pointers to all zeroes.

## Parameters

in	count	The number of buffer array pointers to allocate.
----	-------	--

Definition at line 152 of file [hex2otf.c](#).

```
00153 {
00154     assert (count > 0);

## 5.3.5.37 parseOptions()

**Options** parseOptions (   
 char \*const argv[const ] )

Parse command line options.

Option	Data Type	Description
truetype	bool	Generate TrueType outlines
blankOutline	bool	Generate blank outlines
bitmap	bool	Generate embedded bitmap
gpos	bool	Generate a dummy GPOS table
gsub	bool	Generate a dummy GSUB table
cff	int	Generate CFF 1 or CFF 2 outlines
hex	const char *	Name of Unifont .hex file
pos	const char *	Name of Unifont combining data file
out	const char *	Name of output font file
nameStrings	NameStrings	Array of TrueType font Name IDs

## Parameters

in	argv	Pointer to array of command line options.
----	------	---

## Returns

Data structure to hold requested command line options.

Definition at line 2500 of file [hex2otf.c](#).

### 5.3.5.38 positionGlyphs()

```
void positionGlyphs (  
    Font * font,  
    const char * fileName,  
    pixels_t * xMin )
```

Position a glyph within a 16-by-16 pixel bounding box.

Position a glyph within the 16-by-16 pixel drawing area and note whether or not the glyph is a combining character.

N.B.: Glyphs must be sorted by code point before calling this function.

## Parameters

in,out	font	Font data structure pointer to store glyphs.
in	fileName	Name of glyph file to read.
in	xMin	Minimum x-axis value (for left side bearing).

Definition at line 1061 of file [hex2otf.c](#).

#### 5.3.5.43 readCodePoint()

```
bool readCodePoint (
    uint_fast32_t * codePoint,
    const char * fileName,
    FILE * file )
```

Read up to 6 hexadecimal digits and a colon from file.

This function reads up to 6 hexadecimal digits followed by a colon from a file.

If the end of the file is reached, the function returns true. The file name is provided to include in an error message if the end of file was reached unexpectedly.

## Parameters

out	codePoint	The Uni-code code point.
in	fileName	The name of the input file.
in	file	Pointer to the input file stream.

## Returns

true if at end of file, false otherwise.

Definition at line 919 of file [hex2otf.c](#).

```

00920 {
00921     *codePoint = 0;
00922     uint_fast8_t digitCount = 0;
00923     for (;;)

00941         }
00942         fail ("%s: Unexpected character: %#.2x.", fileName, (unsigned)c);
00943     }
00944 }
```

## 5.3.5.44 readGlyphs()

```

void readGlyphs (
    Font * font,
    const char * fileName )
```

Read glyph definitions from a Unifont .hex format file.

This function reads in the glyph bitmaps contained in a Unifont .hex format file. These input files contain one glyph bitmap per line. Each line is of the form

```
<hexadecimal code point> '?' <hexadecimal bitmap sequence>
```

The code point field typically consists of 4 hexadecimal digits for a code point in Unicode Plane 0, and 6 hexadecimal digits for code points above Plane 0. The hexadecimal bitmap sequence is 32 hexadecimal digits long for a glyph that is 8 pixels wide by 16 pixels high, and 64 hexadecimal digits long for a glyph that is 16 pixels wide by 16 pixels high.

## Parameters

in,out	font	The font data structure to update with new glyphs.
in	fileName	The name of the Unifont .hex format input file.

Definition at line 966 of file `hex2otf.c`.

```

00967 {
00968     FILE *file = fopen (fileName, "r");
00969     if (!file)

#### 5.3.5.48 writeU16()

```
void writeU16 (  
    uint_fast16_t value,  
    FILE * file )
```

Write an unsigned 16-bit value to an output file.

This function writes a 16-bit unsigned value in big-endian order to an output file specified with a file pointer.

Parameters

in	value	The 16-bit value to write.
in	file	The file pointer for writing, of type FILE*.

Definition at line 554 of file [hex2otf.c](#).

```
00555 {  
00556     byte bytes[] =  
00557     {

## 5.3.6 Variable Documentation

### 5.3.6.1 allBuffers

**Buffer\*** allBuffers

Initial allocation of empty array of buffer pointers.

Definition at line 139 of file [hex2otf.c](#).

### 5.3.6.2 bufferCount

size\_t bufferCount

Number of buffers in a **Buffer** \* array.

Definition at line 140 of file [hex2otf.c](#).

### 5.3.6.3 nextBufferIndex

size\_t nextBufferIndex

Index number to tail element of **Buffer** \* array.

Definition at line 141 of file [hex2otf.c](#).

```
#define NAMEPAIR(
    n ) {(n), DEFAULT_ID##n}
Macro to initialize name identifier codes to default values defined above.
Definition at line 84 of file hex2otf.h.
```

### 5.5.2.9 UNIFONT\_VERSION

```
#define UNIFONT_VERSION "16.0.03"
Current Unifont version.
Definition at line 36 of file hex2otf.h.
```

### 5.5.3 Variable Documentation

#### 5.5.3.1 defaultNames

const `NamePair` defaultNames[]

Initial value:

```
=
{
  NAMEPAIR (0),
  NAMEPAIR (1),
  NAMEPAIR (2),
  NAMEPAIR (5),
  NAMEPAIR (11),
  NAMEPAIR (13),
  NAMEPAIR (14),
  {0, NULL}
}
```

Allocate array of NameID codes with default values.

This array contains the default values for several TrueType NameID strings, as defined above in this file. Strings are assigned using the NAMEPAIR macro defined above.

Definition at line 93 of file `hex2otf.h`.

## 5.7 src/johab2syllables.c File Reference

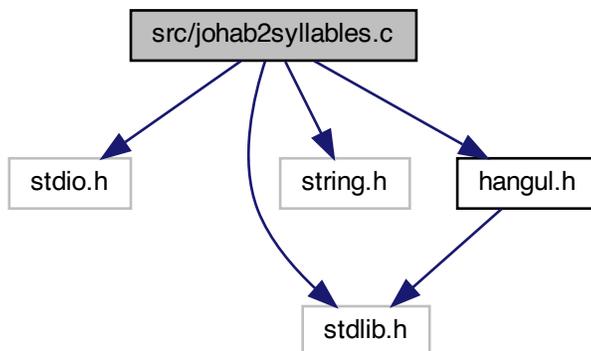

Create the Unicode Hangul Syllables block from component letters.

```

#include <stdio.h>
#include <stdlib.h>
#include <string.h>
#include "hangul.h"

```

Include dependency graph for johab2syllables.c:

## Functions

- `int main (int argc, char *argv[])`  
The main function.
- `void print_help ()`  
Print a help message.

### 5.7.1 Detailed Description

Create the Unicode Hangul Syllables block from component letters.

This program reads in a "hangul-base.hex" file containing Hangul letters in Johab 6/3/1 format and outputs a Unifont .hex format file covering the Unicode Hangul Syllables range of U+AC00..U+D7A3.

00004 @brief Create the Unicode Hangul Syllables block from component letters.
00005
00006 This program reads in a "hangul-base.hex" file containing Hangul
00007 letters in Johab 6/3/1 format and outputs a Unifont .hex format
00008 file covering the Unicode Hangul Syllables range of U+AC00..U+D7A3.

## 5.9 src/unibdf2hex.c File Reference

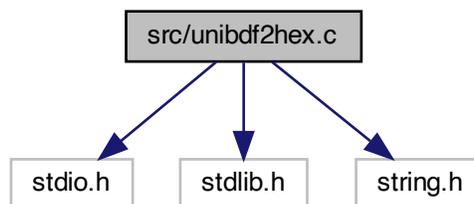

unibdf2hex - Convert a BDF file into a unifont.hex file

```
#include <stdio.h>
```

```
#include <stdlib.h>
```

```
#include <string.h>
```

Include dependency graph for unibdf2hex.c:

### Macros

- #define UNISTART 0x3400

- First Unicode code point to examine.
- `#define UNISTOP 0x4DBF`  
Last Unicode code point to examine.
- `#define MAXBUF 256`  
Maximum allowable input file line length - 1.

## Functions

- `int main ()`  
The main function.

### 5.9.1 Detailed Description

unibdf2hex - Convert a BDF file into a unifont.hex file

Author

Paul Hardy, January 2008

Copyright

Copyright (C) 2008, 2013 Paul Hardy

Note: currently this has hard-coded code points for glyphs extracted from Wen Quan Yi to create the Unifont source file "wqy.hex".

Definition in file [unibdf2hex.c](#).

### 5.9.2 Macro Definition Documentation

#### 5.9.2.1 MAXBUF

```
#define MAXBUF 256
```

Maximum allowable input file line length - 1.

Definition at line [37](#) of file [unibdf2hex.c](#).

#### 5.9.2.2 UNISTART

```
#define UNISTART 0x3400
```

First Unicode code point to examine.

Definition at line [34](#) of file [unibdf2hex.c](#).

#### 5.9.2.3 UNISTOP

```
#define UNISTOP 0x4DBF
```

Last Unicode code point to examine.

Definition at line [35](#) of file [unibdf2hex.c](#).

### 5.9.3 Function Documentation

## 5.9.3.1 main()

```
int main ( )
```

The main function.

Returns

Exit status is always 0 (successful termination).

Definition at line 46 of file [unibdf2hex.c](#).

```
00047 {
00048     int i;

## 5.11 src/unibmp2hex.c File Reference

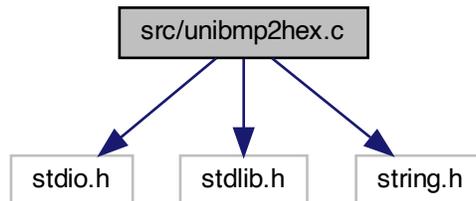

unibmp2hex - Turn a .bmp or .wbmp glyph matrix into a GNU Unifont hex glyph set of 256 characters

```
#include <stdio.h>
```

```
#include <stdlib.h>
```

```
#include <string.h>
```

Include dependency graph for unibmp2hex.c:

## Macros

- `#define MAXBUF 256`  
Maximum input file line length - 1.

## Functions

- int `main` (int argc, char \*argv[])  
The main function.

## Variables

- unsigned `hexdigit` [16][4]  
32 bit representation of 16x8 0..F bitmap
- unsigned `uniplane` =0  
Unicode plane number, 0..0xff ff ff.
- unsigned `planeset` =0  
=1: use plane specified with -p parameter
- unsigned `flip` =0  
=1 if we're transposing glyph matrix
- unsigned `forcewide` =0  
=1 to set each glyph to 16 pixels wide
- unsigned `unidigit` [6][4]
- struct {  
  char `filetype` [2]  
  int `file_size`  
  int `image_offset`  
  int `info_size`  
  int `width`  
  int `height`  
  int `nplanes`  
  int `bits_per_pixel`  
  int `compression`  
  int `image_size`  
  int `x_ppm`  
  int `y_ppm`

Synopsis: unibmp2hex [-iin\_file.bmp] [-oout\_file.hex] [-phex\_page\_num] [-w]  
Definition in file [unibmp2hex.c](#).

### 5.11.2 Macro Definition Documentation

### 5.11.2.1 MAXBUF

```
#define MAXBUF 256
```

Maximum input file line length - 1.

Definition at line [116](#) of file [unibmp2hex.c](#).

## 5.11.3 Function Documentation

### 5.11.3.1 main()

```
int main (
    int argc,
    char * argv[] )
```

The main function.

Parameters

in	argc	The count of command line arguments.
in	argv	Pointer to array of command line arguments.

Returns

This program exits with status 0.

Definition at line [161](#) of file [unibmp2hex.c](#).

## 5.11.4 Variable Documentation

### 5.11.4.1 bits\_per\_pixel

```
int bits_per_pixel
```

Definition at line [139](#) of file [unibmp2hex.c](#).

#### 5.11.4.2

```
struct { ... } bmp_header  
Bitmap Header parameters
```

#### 5.11.4.3 color\_table

```
unsigned char color_table[256][4]  
Bitmap Color Table – maximum of 256 colors in a BMP file  
Definition at line 149 of file unibmp2hex.c.
```

#### 5.11.4.4 compression

```
int compression  
Definition at line 140 of file unibmp2hex.c.
```

#### 5.11.4.5 file\_size

```
int file_size  
Definition at line 133 of file unibmp2hex.c.
```

#### 5.11.4.6 filetype

```
char filetype[2]  
Definition at line 132 of file unibmp2hex.c.
```

#### 5.11.4.7 flip

```
unsigned flip =0  
=1 if we're transposing glyph matrix  
Definition at line 123 of file unibmp2hex.c.
```

#### 5.11.4.8 forcewide

```
unsigned forcewide =0  
=1 to set each glyph to 16 pixels wide  
Definition at line 124 of file unibmp2hex.c.
```

#### 5.11.4.9 height

```
int height  
Definition at line 137 of file unibmp2hex.c.
```

#### 5.11.4.10 hexdigit

unsigned hexdigit[16][4]

32 bit representation of 16x8 0..F bitmap

Definition at line 119 of file [unibmp2hex.c](#).

#### 5.11.4.11 image\_offset

int image\_offset

Definition at line 134 of file [unibmp2hex.c](#).

#### 5.11.4.12 image\_size

int image\_size

Definition at line 141 of file [unibmp2hex.c](#).

#### 5.11.4.13 important\_colors

int important\_colors

Definition at line 145 of file [unibmp2hex.c](#).

#### 5.11.4.14 info\_size

int info\_size

Definition at line 135 of file [unibmp2hex.c](#).

#### 5.11.4.15 ncolors

int ncolors

Definition at line 144 of file [unibmp2hex.c](#).

#### 5.11.4.16 nplanes

int nplanes

Definition at line 138 of file [unibmp2hex.c](#).

#### 5.11.4.17 planeset

unsigned planeset =0

=1: use plane specified with -p parameter

Definition at line 122 of file [unibmp2hex.c](#).

#### 5.11.4.18 unidigit

unsigned unidigit[6][4]

The six Unicode plane digits, from left-most (0) to right-most (5)

Definition at line 127 of file [unibmp2hex.c](#).

#### 5.11.4.19 uniplane

unsigned uniplane =0

Unicode plane number, 0..0xff ff ff.

Definition at line 121 of file [unibmp2hex.c](#).

#### 5.11.4.20 width

int width

Definition at line 136 of file [unibmp2hex.c](#).

#### 5.11.4.21 x\_ppm

int x\_ppm

Definition at line 142 of file [unibmp2hex.c](#).

#### 5.11.4.22 y\_ppm

int y\_ppm

Definition at line 143 of file [unibmp2hex.c](#).

00030
00031  /*
00032  2 September 2024 [Paul Hardy] - Set these scripts to double width:
00033  - U+10D40..U+10D8F (Garay)
00034  - U+11380..U+113FF (Tulu-Tigalari)
00035  - U+116D0..U+116FF (Myanmar Extended-C)
00036  - U+11F00..U+11F5F (Kawi)
00037  - U+16100..U+1613F (Gurung Khema)
00038  - U+16D40..U+16D7F (Kirat Rai)
00039  - U+18B00..U+18CFF (Khitani Small Script)
00040  - U+1E5D0..U+1E5FF (Ol Onal)
00041
00042  6 September 2021 [Paul Hardy]:
```

```

00043 - Set U+12F90..U+12FFF (Cypro-Minoan) to be double width.
00044 - Set U+1CF00..U+1CFCF (Znamenny Musical Notation) to be double width.
00045 - Set U+1AFF0..U+1AFFF (Kana Extended-B) to be double width.
00046
00047 20 June 2017 [Paul Hardy]:
00048 - Modify to allow hard-coding of quadruple-width hex glyphs.
00049 The 32nd column (rightmost column) is cleared to zero, because
00050 that column contains the vertical cell border.
00051 - Set U+9FD8..U+9FE9 (complex CJK) to be quadruple-width.
00052 - Set U+011A00..U+011A4F (Masaram Gondi, non-digits) to be wide.
00053 - Set U+011A50..U+011AAF (Soyombo) to be wide.
00054
00055 8 July 2017 [Paul Hardy]:
00056 - All CJK glyphs in the range U+4E00..u+9FFF are double width
00057 again; commented out the line that sets U+9FD8..U+9FE9 to be
00058 quadruple width.
00059
00060 6 August 2017 [Paul Hardy]:
00061 - Remove hard-coding of U+01D200..U+01D24F Ancient Greek Musical
00062 Notation to double-width; allow range to be dual-width.
00063
00064 12 August 2017 [Paul Hardy]:
00065 - Remove Miao script from list of wide scripts, so it can contain
00066 single-width glyphs.
00067
00068 26 December 2017 Paul Hardy:
00069 - Removed Tibetan from list of wide scripts, so it can contain
00070 single-width glyphs.
00071 - Added a number of scripts to be explicitly double-width in case
00072 they are redrawn.
00073 - Added Miao script back as wide, because combining glyphs are
00074 added back to font/plane01/plane01-combining.txt.
00075
00076 05 June 2018 Paul Hardy:
00077 - Made U+2329] and U+232A wide.
00078 - Added to wide settings for CJK Compatibility Forms over entire range.
00079 - Made Kayah Li script double-width.
00080 - Made U+232A (Right-pointing Angle Bracket) double-width.
00081 - Made U+01F5E7 (Three Rays Right) double-width.
00082
00083 July 2018 Paul Hardy:
00084 - Changed 2017 to 2018 in previous change entry.
00085 - Added Dogra (U+011800..U+01184F) as double width.
00086 - Added Makasar (U+011EE0..U+011EFF) as double width.
00087
00088 23 February 2019 [Paul Hardy]:
00089 - Set U+119A0..U+119FF (Nandinagari) to be wide.
00090 - Set U+1E2C0..U+1E2FF (Wancho) to be wide.
00091
00092 25 May 2019 [Paul Hardy]:
00093 - Added support for the case when the original .bmp monochrome
00094 file has been converted to a 32 bit per pixel RGB file.
00095 - Added support for bitmap images stored from either top to bottom
00096 or bottom to top.
00097 - Add DEBUG compile flag to print header information, to ease
00098 adding support for additional bitmap formats in the future.
00099
00100 13 March 2022 [Paul Hardy]:
00101 - Added support for 24 bits per pixel RGB file.
00102
00103 12 June 2022 [Paul Hardy]:
00104 - Set U+11B00..U+11B5F (Devanagari Extended-A) to be wide.
00105 - Set U+11F00..U+11F5F (Kawi) to be wide.
00106
00107 19 April 2025 [Paul Hardy]:
00108 - Remove hard-coding of U+1D100..U+1D1FF (Musical Symbols)
00109 to double-width; allow range to be dual-width.

## Macros

- `#define VERSION "1.0"`  
Version of this program.
- `#define MAX_COMPRESSION_METHOD 13`  
Maximum supported compression method.

## Functions

- `int main (int argc, char *argv[])`  
The main function.
- `unsigned get_bytes (FILE *infp, int nbytes)`  
Get from 1 to 4 bytes, inclusive, from input file.
- `void regrid (unsigned *image_bytes)`  
After reading in the image, shift it.

### 5.13.1 Detailed Description

`unibmpbump` - Adjust a Microsoft bitmap (.bmp) file that was created by `unihex2png` but converted to .bmp

Author

Paul Hardy, `unifoundry <at> unifoundry.com`

Copyright

Copyright (C) 2019 Paul Hardy

This program shifts the glyphs in a bitmap file to adjust an original PNG file that was saved in BMP format. This is so the result matches the format of a `unihex2bmp` image. This conversion then lets `unibmp2hex` decode the result.

Synopsis: `unibmpbump [-iin_file.bmp] [-oout_file.bmp]`

Definition in file `unibmpbump.c`.

### 5.13.2 Macro Definition Documentation

### 5.13.2.1 MAX\_COMPRESSION\_METHOD

```
#define MAX_COMPRESSION_METHOD 13
```

Maximum supported compression method.  
Definition at line 40 of file [unibmpbump.c](#).

### 5.13.2.2 VERSION

```
#define VERSION "1.0"
```

Version of this program.  
Definition at line 38 of file [unibmpbump.c](#).

## 5.13.3 Function Documentation

### 5.13.3.1 get\_bytes()

```
unsigned get_bytes (
    FILE * infp,
    int nbytes )
```

Get from 1 to 4 bytes, inclusive, from input file.

Parameters

in	infp	Pointer to input file.
in	nbytes	Number of bytes to read, from 1 to 4, inclusive.

Returns

The unsigned 1 to 4 bytes in machine native endian format.

Definition at line 487 of file [unibmpbump.c](#).

```
00487     {
00488     int i;
00489     unsigned char inchar[4];
00490     unsigned inword;
00491
00492     for (i = 0; i < nbytes; i++) {
00493         if (fread (&inchar[i], 1, 1, infp) != 1) {
00494             inchar[i] = 0;
00495         }
00496     }
00497     for (i = nbytes; i < 4; i++) inchar[i] = 0;
00498
00499     inword = ((inchar[3] & 0xFF) << 24) | ((inchar[2] & 0xFF) << 16) |
00500             ((inchar[1] & 0xFF) << 8) | (inchar[0] & 0xFF);
00501
00502     return inword;
```

```
00503 }
```

### 5.13.3.2 main()

```
int main (
    int argc,
    char * argv[] )
```

The main function.

Parameters

in	argc	The count of command line arguments.
in	argv	Pointer to array of command line arguments.

Returns

This program exits with status EXIT\_SUCCESS.

Definition at line 50 of file [unibmpbump.c](#).

```

After reading in the image, shift it.

This function adjusts the input image from an original PNG file to match [unihex2bmp.c](#) format.

Parameters

in,out	image_bytes	The pixels in an image.
--------	-------------	-------------------------

Definition at line 514 of file [unibmpbump.c](#).

00001 /**
00002  @file unibmpbump.c
00003
00004  @brief unibmpbump - Adjust a Microsoft bitmap (.bmp) file that
00005  was created by unihex2png but converted to .bmp
00006
00007  @author Paul Hardy, unifoundry <at> unifoundry.com
00008
00009  @copyright Copyright (C) 2019 Paul Hardy
00010
00011  This program shifts the glyphs in a bitmap file to adjust an
00012  original PNG file that was saved in BMP format. This is so the
00013  result matches the format of a unihex2bmp image. This conversion
00014  then lets unibmp2hex decode the result.
00015

## 5.15 src/unicoverage.c File Reference

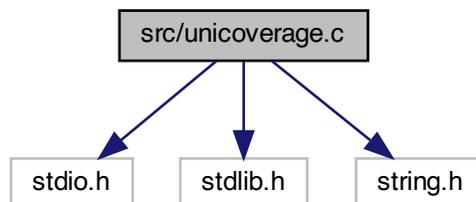

unicoverage - Show the coverage of Unicode plane scripts for a GNU Unifont hex glyph file

```
#include <stdio.h>
```

```
#include <stdlib.h>
```

```
#include <string.h>
```

Include dependency graph for unicoverage.c:

## Macros

- `#define MAXBUF 256`  
Maximum input line length - 1.

## Functions

- `int main (int argc, char *argv[])`  
The main function.
- `int nextrange (FILE *coveragefp, int *cstart, int *cend, char *coverstring)`  
Get next Unicode range.
- `void print\_subtotal (FILE *outfp, int print_n, int nglyphs, int cstart, int cend, char *coverstring)`  
Print the subtotal for one Unicode script range.

### 5.15.1 Detailed Description

unicoverage - Show the coverage of Unicode plane scripts for a GNU Unifont hex glyph file

#### Author

Paul Hardy, [unifoundry <at> unifoundry.com](mailto:unifoundry@unifoundry.com), 6 January 2008

#### Copyright

Copyright (C) 2008, 2013 Paul Hardy

Synopsis: `unicoverage [-ifont_file.hex] [-ocoverage_file.txt]`

This program requires the file "coverage.dat" to be present in the directory from which it is run.

Definition in file [unicoverage.c](#).

### 5.15.2 Macro Definition Documentation

#### 5.15.2.1 MAXBUF

```
#define MAXBUF 256
```

Maximum input line length - 1.

### 5.15.3 Function Documentation

#### 5.15.3.1 main()

```
int main (  
    int argc,  
    char * argv[] )
```

The main function.

## Parameters

in	argc	The count of command line arguments.
in	argv	Pointer to array of command line arguments.

## Returns

This program exits with status 0.

Definition at line 71 of file `unicoverage.c`.

```

Here is the call graph for this function:

### 5.15.3.2 nextrange()

```
int nextrange (
    FILE * coveragefp,
    int * cstart,
    int * cend,
    char * coverstring )
```

Get next Unicode range.

This function reads the next Unicode script range to count its glyph coverage.

Parameters

in	coveragefp	File pointer to Unicode script range data file.
in	cstart	Starting code point in current Unicode script range.

## Parameters

in	cend	Ending code point in current Unicode script range.
out	coverstring	String containing <code>&lt;start&gt;</code> - <code>&lt;end&gt;</code> substring.

## Returns

Length of the last string read, or 0 for end of file.

Definition at line 192 of file `unicoverage.c`.

```

00195 {
00196     int i;
00197     static char inbuf[MAXBUF];
00198     int retval; /* the return value */
00199
00200     retval = 0;
00201
00202     do {
00203         if (fgets (inbuf, MAXBUF-1, coveragefp) != NULL) {
00204             retval = strlen (inbuf);
00205             if ((inbuf[0] >= '0' && inbuf[0] <= '9') ||
00206                 (inbuf[0] >= 'A' && inbuf[0] <= 'F') ||
00207                 (inbuf[0] >= 'a' && inbuf[0] <= 'f')) {
00208                 sscanf (inbuf, "%x-%x", cstart, cend);
00209                 i = 0;
00210                 while (inbuf[i] != ' ') i++; /* find first blank */
00211                 while (inbuf[i] == ' ') i++; /* find next non-blank */
00212                 strncpy (coverstring, &inbuf[i], MAXBUF);
00213             }
00214             else retval = 0;
00215         }
00216         else retval = 0;
00217     } while (retval == 0 && !feof (coveragefp));
00218
00219     return (retval);
00220 }

```

Here is the caller graph for this function:

### 5.15.3.3 print\_subtotal()

```
void print_subtotal (
    FILE * outfp,
    int print_n,
    int nglyphs,
    int cstart,
    int cend,
    char * coverstring )
```

Print the subtotal for one Unicode script range.

#### Parameters

in	outfp	Pointer to output file.
in	print_n	1 = print number of glyphs, 0 = print percentage.
in	nglyphs	Number of glyphs in current range.
in	cstart	Starting code point for current range.
in	cend	Ending code point for current range.

## Parameters

in	coverstring	Character string of " <code>&lt;start&gt;</code> "- <code>&lt;end&gt;</code> ".
----	-------------	---

00031 */
00032
00033 /*
00034 2016 (Paul Hardy): Modified in Unifont 9.0.01 release to remove non-existent
00035 "-p" option and empty example from help printout.
00036
00037 2018 (Paul Hardy): Modified to cover entire Unicode range, not just Plane 0.
00038
00039 11 May 2019: [Paul Hardy] changed strcpy function call to strlcpy
00040 for better error handling.
00041
00042 31 May 2019: [Paul Hardy] replaced strlcpy call with strncpy
00043 for compilation on more systems.
00044
00045 4 June 2022: [Paul Hardy] Adjusted column spacing for better alignment
00046 of Unicode Plane 1-15 scripts. Added "-n" option to print number of
00047 glyphs in each range instead of percent coverage.
00048
00049 18 September 2022: [Paul Hardy] in nextrange function, initialize retval.
00050
00051 21 October 2023: [Paul Hardy]
00052 Added full function prototype for nextrange function in main function.

### 5.19.2 Function Documentation

## 5.19.2.1 glyph2bits()

```
void glyph2bits (
    int width,
    unsigned char glyph[16][2],
    unsigned char glyphbits[16][16] )
```

Convert a Unifont binary glyph into a binary glyph array of bits.

This function takes a Unifont 16-row by 1- or 2-byte wide binary glyph and returns an array of 16 rows by 16 columns. For each output array element, a 1 indicates the corresponding bit was set in the binary glyph, and a 0 indicates the corresponding bit was not set.

## Parameters

in	width	The number of columns in the glyph.
in	glyph	The binary glyph, as a 16-row by 2-byte array.
out	glyphbits	The converted glyph, as a 16-row, 16-column array.

Definition at line 91 of file [unifont-support.c](#).

```
00093     {
00094
00095     unsigned char tmp_byte;
00096     unsigned char mask;
00097     int row, column;
00098
00099     for (row = 0; row < 16; row++) {
00100         tmp_byte = glyph [row][0];
00101         mask = 0x80;
00102         for (column = 0; column < 8; column++) {
00103             glyphbits [row][column] = tmp_byte & mask ? 1 : 0;
00104             mask »= 1;
00105         }
00106
00107         if (width > 8)
00108             tmp_byte = glyph [row][1];
00109         else
00110             tmp_byte = 0x00;
00111
00112         mask = 0x80;
00113         for (column = 8; column < 16; column++) {
```

```

00114     glyphbits [row][column] = tmp_byte & mask ? 1 : 0;
00115     mask »= 1;
00116     }
00117 }
00118
00119
00120 return;
00121 }

```

### 5.19.2.2 glyph2string()

```

void glyph2string (
    int width,
    unsigned codept,
    unsigned char glyph[16][2],
    char * outstring )

```

Convert a glyph code point and byte array into a Unifont .hex string.

This function takes a code point and a 16-row by 1- or 2-byte binary glyph, and converts it into a Unifont .hex format character array.

#### Parameters

in	width	The number of columns in the glyph.
in	codept	The code point to appear in the output .hex string.
in	glyph	The glyph, with each of 16 rows 1 or 2 bytes wide.

## Parameters

out	outstring	The output string, in Unifont .hex format.
-----	-----------	--

Definition at line 221 of file `unifont-support.c`.

```

00223     {
00224
00225     int i;           /* index into outstring array */
00226     int row;
00227
00228     if (codept <= 0xFFFF) {
00229         sprintf (outstring, "%04X:", codept);
00230         i = 5;
00231     }
00232     else {
00233         sprintf (outstring, "%06X:", codept);
00234         i = 7;
00235     }
00236
00237     for (row = 0; row < 16; row++) {
00238         sprintf (&outstring[i], "%02X", glyph [row][0]);
00239         i += 2;
00240
00241         if (width > 8) {
00242             sprintf (&outstring[i], "%02X", glyph [row][1]);
00243             i += 2;
00244         }
00245     }
00246
00247     outstring[i] = '\0'; /* terminate output string */
00248
00249
00250     return;
00251 }

```

### 5.19.2.3 hexpose()

```

void hexpose (
    int width,
    unsigned char glyphbits[16][16],
    unsigned char transpose[2][16] )

```

Transpose a Unifont .hex format glyph into 2 column-major sub-arrays.

This function takes a 16-by-16 cell bit array made from a Unifont glyph (as created by the `glyph2bits` function) and outputs a transposed array of 2 sets of 8 or 16 columns, depending on the glyph width. This format simplifies outputting these bit patterns on a graphics display with a controller chip designed to output a column of 8 pixels at a time.

For a line of text with Unifont output, first all glyphs can have their first 8 rows of pixels displayed on a line. Then the second 8 rows of all glyphs on the line can be displayed. This simplifies code for such controller chips that are designed to automatically increment input bytes of column data by one column at a time for each successive byte.

The `glyphbits` array contains a '1' in each cell where the corresponding non-transposed glyph has a pixel set, and 0 in each cell where a pixel is not set.

## Parameters

in	width	The number of columns in the glyph.
in	glyphbits	The 16-by-16 pixel glyph bits.
out	transpose	The array of 2 sets of 8 or 16 columns of 8 pixels.

Definition at line 150 of file [unifont-support.c](#).

```

00152                                     {
00153
00154     int column;
00155
00156
00157     for (column = 0; column < 8; column++) {
00158         transpose [0][column] =
00159             (glyphbits [ 0][column] << 7) |

00202   }
00203
00204
00205   return;
00206 }

```

#### 5.19.2.4 parse\_hex()

```

void parse_hex (
    char * hexstring,
    int * width,
    unsigned * codept,
    unsigned char glyph[16][2] )

```

Decode a Unifont .hex file into Unicode code point and glyph.

This function takes one line from a Unifont .hex file and decodes it into a code point followed by a 16-row glyph array. The glyph array can be one byte (8 columns) or two bytes (16 columns).

##### Parameters

in	hexstring	The Unicode .hex string for one code point.
out	width	The number of columns in a glyph with 16 rows.
out	codept	The code point, contained in the first .hex file field.

## Parameters

out	glyph	The Unifont glyph, as 16 rows by 1 or 2 bytes wide.
-----	-------	---

Definition at line 44 of file [unifont-support.c](#).

```

00047         {
00048
00049     int i;
00050     int row;
00051     int length;
00052
00053     sscanf (hexstring, "%X", codept);
00054     length = strlen (hexstring);
00055     for (i = length - 1; i > 0 && hexstring[i] != '\n'; i--);
00056     hexstring[i] = '\0';
00057     for (i = 0; i < 9 && hexstring[i] != ':'; i++);
00058     i++; /* Skip over ':' */
00059     *width = (length - i) * 4 / 16; /* 16 rows per glyphbits */
00060
00061     for (row = 0; row < 16; row++) {
00062         sscanf (&hexstring[i], "%2hhX", &glyph [row][0]);
00063         i += 2;
00064         if (*width > 8) {
00065             sscanf (&hexstring[i], "%2hhX", &glyph [row][1]);
00066             i += 2;
00067         }
00068         else {
00069             glyph [row][1] = 0x00;
00070         }
00071     }
00072
00073
00074     return;
00075 }

```

## 5.19.2.5 xglyph2string()

```

void xglyph2string (
    int width,
    unsigned codept,
    unsigned char transpose[2][16],
    char * outstring )

```

Convert a code point and transposed glyph into a Unifont .hex string.

This function takes a code point and a transposed Unifont glyph of 2 rows of 8 pixels in a column, and converts it into a Unifont .hex format character array.

## Parameters

in	width	The number of columns in the glyph.
----	-------	-------------------------------------

## Parameters

in	codept	The code point to appear in the output .hex string.
in	transpose	The transposed glyph, with 2 sets of 8-row data.
out	outstring	The output string, in Unifont .hex format.

Definition at line 267 of file [unifont-support.c](#).

```

00269     {
00270
00271     int i;          /* index into outstring array */
00272     int column;
00273

00123
00124 /**
00125 @brief Transpose a Unifont .hex format glyph into 2 column-major sub-arrays.
00126
00127 This function takes a 16-by-16 cell bit array made from a Unifont
00128 glyph (as created by the glyph2bits function) and outputs a transposed
00129 array of 2 sets of 8 or 16 columns, depending on the glyph width.
00130 This format simplifies outputting these bit patterns on a graphics
00131 display with a controller chip designed to output a column of 8 pixels
00132 at a time.
00133
00134 For a line of text with Unifont output, first all glyphs can have
00135 their first 8 rows of pixels displayed on a line. Then the second
00136 8 rows of all glyphs on the line can be displayed. This simplifies
00137 code for such controller chips that are designed to automatically
00138 increment input bytes of column data by one column at a time for
00139 each successive byte.
00140
00141 The glyphbits array contains a '1' in each cell where the corresponding
00142 non-transposed glyph has a pixel set, and 0 in each cell where a pixel
00143 is not set.
00144
00145 @param[in] width The number of columns in the glyph.
00146 @param[in] glyphbits The 16-by-16 pixel glyph bits.
00147 @param[out] transpose The array of 2 sets of 8 or 16 columns of 8 pixels.

#### 5.21.1 Detailed Description

unifont1per - Read a Unifont .hex file from standard input and produce one glyph per ".bmp" bitmap file as output

#### Author

Paul Hardy, [unifoundry <at> unifoundry.com](mailto:unifoundry@unifoundry.com), December 2016

#### Copyright

Copyright (C) 2016, 2017 Paul Hardy

Each glyph is 16 pixels tall, and can be 8, 16, 24, or 32 pixels wide. The width of each output graphic file is determined automatically by the width of each Unifont hex representation.

This program creates files of the form "U+<codepoint>.bmp", 1 per glyph.

Synopsis: `unifont1per < unifont.hex`

Definition in file [unifont1per.c](#).

#### 5.21.2 Macro Definition Documentation

## 5.21.2.1 MAXFILENAME

```
#define MAXFILENAME 20
```

Maximum size of a filename of the form "U+%06X.bmp".

Definition at line 60 of file [unifont1per.c](#).

## 5.21.2.2 MAXSTRING

```
#define MAXSTRING 266
```

Maximum size of an input line in a Unifont .hex file - 1.

Definition at line 57 of file [unifont1per.c](#).

## 5.21.3 Function Documentation

## 5.21.3.1 main()

```
int main ( )
```

The main function.

Returns

This program exits with status EXIT\_SUCCESS.

Definition at line 69 of file [unifont1per.c](#).

```

00001 /**
00002 @file unifont1per.c
00003
00004 @brief unifont1per - Read a Unifont .hex file from standard input and
00005 produce one glyph per ".bmp" bitmap file as output
00006
00007 @author Paul Hardy, unifoundry <at> unifoundry.com, December 2016
00008
00009 @copyright Copyright (C) 2016, 2017 Paul Hardy
00010
00011 Each glyph is 16 pixels tall, and can be 8, 16, 24,
00012 or 32 pixels wide. The width of each output graphic

```

```

00013 file is determined automatically by the width of each
00014 Unifont hex representation.
00015
00016 This program creates files of the form "U+<codepoint>.bmp", 1 per glyph.

### Macros

- #define [HDR\\_LEN](#) 33

### Functions

- int [main](#) (int argc, char \*\*argv)  
The main function.
- void [output4](#) (int thisword)  
Output a 4-byte integer in little-endian order.
- void [output2](#) (int thisword)  
Output a 2-byte integer in little-endian order.
- void [gethex](#) (char \*instring, int plane\_array[0x10000][16], int plane)  
Read a Unifont .hex-format input file from stdin.
- void [genlongbmp](#) (int plane\_array[0x10000][16], int dpi, int tinynum, int plane)  
Generate the BMP output file in long format.
- void [genwidebmp](#) (int plane\_array[0x10000][16], int dpi, int tinynum, int plane)  
Generate the BMP output file in wide format.

#### 5.23.1 Detailed Description

unifontpic - See the "Big Picture": the entire Unifont in one BMP bitmap

Author

Paul Hardy, 2013

Copyright

Copyright (C) 2013, 2017 Paul Hardy

Definition in file [unifontpic.c](#).

## 5.23.2 Macro Definition Documentation

### 5.23.2.1 HDR\_LEN

```
#define HDR_LEN 33
```

Define length of header string for top of chart.

Definition at line [73](#) of file [unifontpic.c](#).

## 5.23.3 Function Documentation

### 5.23.3.1 genlongbmp()

```
void genlongbmp (
    int plane_array[0x10000][16],
    int dpi,
    int tinynum,
    int plane )
```

Generate the BMP output file in long format.

This function generates the BMP output file from a bitmap parameter. This is a long bitmap, 16 glyphs wide by 4,096 glyphs tall.

Parameters

in	plane_array	The array of glyph bitmaps for a plane.
in	dpi	Dots per inch, for encoding in the BMP output file header.

## Parameters

in	tinynum	Whether to generate tiny numbers in wide grid (unused).
in	plane	The Unicode plane, 0..17.

Definition at line 303 of file `unifontpic.c`.

Here is the caller graph for this function:

### 5.23.3.2 genwidebmp()

```

void genwidebmp (
    int plane_array[0x10000][16],
    int dpi,
    int tinynum,
    int plane )
  
```

Generate the BMP output file in wide format.

This function generates the BMP output file from a bitmap parameter. This is a wide bitmap, 256 glyphs wide by 256 glyphs tall.

Parameters

in	plane_array	The array of glyph bitmaps for a plane.
----	-------------	---

## Parameters

in	dpi	Dots per inch, for encoding in the BMP output file header.
in	tinynum	Whether to generate tiny numbers in 256x256 grid.
in	plane	The Unicode plane, 0..17.

Definition at line 590 of file `unifontpic.c`.

### 5.23.3.3 gethex()

```

void gethex (
    char * instring,
    int plane_array[0x10000][16],
    int plane )

```

Read a Unifont .hex-format input file from stdin.

Each glyph can be 2, 4, 6, or 8 ASCII hexadecimal digits wide. [Glyph](#) height is fixed at 16 pixels.

## Parameters

in	instring	One line from a Unifont .hex-format file.
in,out	plane_array	Bitmap for this plane, one bitmap row per element.
in	plane	The Unicode plane, 0..17.

Definition at line 224 of file [unifontpic.c](#).

```

00225 {
00226     char *bitstring; /* pointer into instring for glyph bitmap */
00227     int i; /* loop variable */

00026 */
00027
00028 /*
00029 11 June 2017 [Paul Hardy]:
00030 - Modified to take glyphs that are 24 or 32 pixels wide and
00031 compress them horizontally by 50%.
00032
00033 8 July 2017 [Paul Hardy]:
00034 - Modified to print Unifont charts above Unicode Plane 0.
00035 - Adds "-P" option to specify Unicode plane in decimal,
00036 as "-P0" through "-P17". Omitting this argument uses
00037 plane 0 as the default.
00038 - Appends Unicode plane number to chart title.
00039 - Reads in "unifontpic.h", which was added mainly to
00040 store ASCII chart title glyphs in an embedded array
00041 rather than requiring these ASCII glyphs to be in
00042 the ".hex" file that is read in for the chart body
00043 (which was the case previously, when all that was
00044 able to print was Unicode place 0).
00045 - Fixes truncated header in long bitmap format, making
00046 the long chart title glyphs single-spaced. This leaves
00047 room for the Unicode plane to appear even in the narrow
00048 chart title of the "long" format chart. The wide chart
00049 title still has double-spaced ASCII glyphs.
00050 - Adjusts centering of title on long and wide charts.
00051
00052 11 May 2019 [Paul Hardy]:
00053 - Changed strncpy calls to memcpy.
  
```

```

00054 - Added "HDR_LEN" to define length of header string
00055 for use in sprintf function call.
00056 - Changed sprintf function calls to sprintf function
00057 calls for writing chart header string.
00058
00059 21 October 2023 [Paul Hardy]:
00060 - Added full function prototypes in main function for
00061 functions gethex, genlongbmp, and genwidebmp.
00062 - Typecast ascii_hex[i] to char * in gethex function call
00063 to avoid warning about const char * conversion.

## 5.25 src/unifontpic.h File Reference

[unifontpic.h](#) - Header file for [unifontpic.c](#)

This graph shows which files directly or indirectly include this file:

### Macros

- `#define MAXSTRING 256`  
Maximum input string allowed.
- `#define HEADER_STRING "GNU Unifont 16.0.03"`  
To be printed as chart title.

### Variables

- `const char * ascii_hex [128]`  
Array of Unifont ASCII glyphs for chart row & column headings.
- `int ascii_bits [128][16]`

- Array to hold ASCII bitmaps for chart title.
- char [hexdigit](#) [16][5]  
Array of 4x5 hexadecimal digits for legend.

### 5.25.1 Detailed Description

[unifontpic.h](#) - Header file for [unifontpic.c](#)

Author

Paul Hardy, July 2017

Copyright

Copyright (C) 2017 Paul Hardy

Definition in file [unifontpic.h](#).

### 5.25.2 Macro Definition Documentation

#### 5.25.2.1 HEADER\_STRING

```
#define HEADER_STRING "GNU Unifont 16.0.03"
```

To be printed as chart title.  
Definition at line [32](#) of file [unifontpic.h](#).

#### 5.25.2.2 MAXSTRING

```
#define MAXSTRING 256
```

Maximum input string allowed.  
Definition at line [30](#) of file [unifontpic.h](#).

### 5.25.3 Variable Documentation

#### 5.25.3.1 ascii\_bits

```
int ascii_bits[128][16]
```

Array to hold ASCII bitmaps for chart title.  
This array will be created from the strings in `ascii_hex[]` above.  
Definition at line [179](#) of file [unifontpic.h](#).

#### 5.25.3.2 ascii\_hex

```
const char* ascii_hex[128]
```

Array of Unifont ASCII glyphs for chart row & column headings.  
Define the array of Unifont ASCII glyphs, code points 0 through 127. This allows using `unifontpic` to print charts of glyphs above Unicode Plane 0. These were copied from `font/plane00/unifont-base.hex`, plus U+0020 (ASCII space character).  
Definition at line [42](#) of file [unifontpic.h](#).

## 5.25.3.3 hexdigit

```
char hexdigit[16][5]
```

Initial value:

```
= {
  {0x6,0x9,0x9,0x9,0x6},
  {0x2,0x6,0x2,0x2,0x7},
  {0xF,0x1,0xF,0x8,0xF},
  {0xE,0x1,0x7,0x1,0xE},
  {0x9,0x9,0xF,0x1,0x1},
  {0xF,0x8,0xF,0x1,0xF},
  {0x6,0x8,0xE,0x9,0x6},
  {0xF,0x1,0x2,0x4,0x4},
  {0x6,0x9,0x6,0x9,0x6},
  {0x6,0x9,0x7,0x1,0x6},
  {0xF,0x9,0xF,0x9,0x9},
  {0xE,0x9,0xE,0x9,0xE},
  {0x7,0x8,0x8,0x8,0x7},
  {0xE,0x9,0x9,0x9,0xE},
  {0xF,0x8,0xE,0x8,0xF},
  {0xF,0x8,0xE,0x8,0x8}
}
```

Array of 4x5 hexadecimal digits for legend.

hexdigit contains 4x5 pixel arrays of tiny digits for the legend. See [unihexgen.c](#) for a more detailed description in the comments.

Definition at line 188 of file [unifontpic.h](#).

## 5.27 src/unigen-hangul.c File Reference

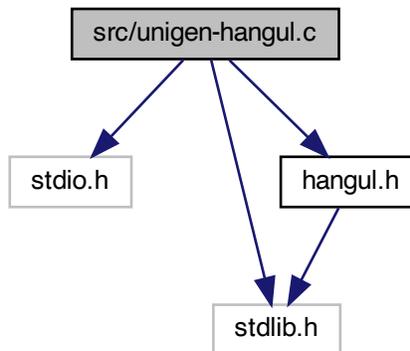

Generate arbitrary hangul syllables.

```
#include <stdio.h>
```

```
#include <stdlib.h>
```

```
#include "hangul.h"
```

Include dependency graph for unigen-hangul.c:

### Data Structures

- struct [PARAMS](#)

### Functions

- int [main](#) (int argc, char \*argv[])  
Program entry point.
- void [parse\\_args](#) (int argc, char \*argv[], struct [PARAMS](#) \*params)  
Parse command line arguments.
- void [get\\_hex\\_range](#) (char \*instring, unsigned \*start, unsigned \*end)  
Scan a hexadecimal range from a character string.

#### 5.27.1 Detailed Description

Generate arbitrary hangul syllables.

Input is a Unifont .hex file such as the "hangul-base.hex" file that is included in the Unifont package.

The default program parameters will generate the Unicode Hangul Syllables range of U+AC00..U+D7A3.

The syllables will appear in this order:

```

For each modern choseong {
  For each modern jungseong {
    Output syllable of choseong and jungseong
    For each modern jongseong {
      Output syllable of choseong + jungseong + jongseong
    }
  }
}

```

By starting the jongseong code point at one before the first valid jongseong, the first inner loop iteration will add a blank glyph for the jongseong portion of the syllable, so only the current choseong and jungseong will be output first.

## 5.27.2 Function Documentation

### 5.27.2.1 `get_hex_range()`

```
void get_hex_range (
    char * instring,
    unsigned * start,
    unsigned * end )
```

Scan a hexadecimal range from a character string.

Definition at line 354 of file [unigen-hangul.c](#).

```
00354     {
00355
00356     int i; /* String index variable. */
00357
00358     /* Get first number in range. */
00359     sscanf (instring, "%X", start);
00360     for (i = 0;
00361          instring [i] != '\0' && instring [i] != '-';
00362          i++);
00363     /* Get last number in range. */
00364     if (instring [i] == '-') {
00365         i++;
00366         sscanf (&instring [i], "%X", end);
00367     }
00368     else {
00369         *end = *start;
00370     }
00371
00372     return;
00373 }
```

Here is the caller graph for this function:

## 5.27.2.2 main()

```
int main (
    int argc,
    char * argv[] )
```

## 5.28 unigen-hangul.c

[Go to the documentation of this file.](#)

```

00001 /**
00002  @file unigen-hangul.c
00003
00004  @brief Generate arbitrary hangul syllables.
00005
00006  Input is a Unifont .hex file such as the "hangul-base.hex" file that
00007  is included in the Unifont package.
00008
00009  The default program parameters will generate the Unicode
00010  Hangul Syllables range of U+AC00..U+D7A3. The syllables
00011  will appear in this order:
00012
00013  For each modern choseong {
00014  For each modern jungseong {
00015  Output syllable of choseong and jungseong
00016  For each modern jongseong {
00017  Output syllable of choseong + jungseong + jongseong
00018  }
00019  }
00020  }
00021
00022  By starting the jongseong code point at one before the first
00023  valid jongseong, the first inner loop iteration will add a
00024  blank glyph for the jongseong portion of the syllable, so
00025  only the current choseong and jungseong will be output first.

### 5.29.3 Function Documentation

#### 5.29.3.1 add\_double\_circle()

```
void add_double_circle (
    char * glyphstring,
    int offset )
```

Superimpose a double-width dashed combining circle on a glyph bitmap.

Parameters

in,out	glyphstring	A double-width glyph, 16x16 pixels.
--------	-------------	-------------------------------------

### 5.29.3.3 main()

```
int main (
    int argc,
    char ** argv )
```

The main function.

Parameters

in	argc	The count of command line arguments.
in	argv	Pointer to array of command line arguments.

Returns

This program exits with status `EXIT_SUCCESS`.

Definition at line 73 of file `unigencircles.c`.

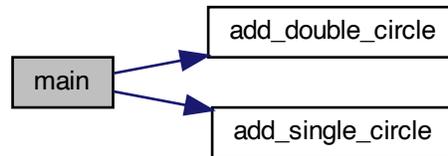

```

00026 */
00027
00028 /*
00029 8 July 2017 [Paul Hardy]:
00030 - Reads new second field that contains an x-axis offset for
00031 each combining character in "*"combining.txt" files.
00032 - Uses the above x-axis offset value for a combining character
00033 to print combining circle in the left half of a double
00034 diacritic combining character grid, or in the center for
00035 other combining characters.
00036 - Adds exceptions for U+01107F (Brahmi number joiner) and
00037 U+01D1A0 (vertical stroke musical ornament); they are in
00038 a combining.txt file for positioning, but are not actually
00039 Unicode combining characters.
00040 - Typo fix: "single-width"-->"double-width" in comment for
00041 add_double_circle function.
00042
00043 12 August 2017 [Paul Hardy]:
00044 - Hard-code Miao vowels to show combining circles after
00045 removing them from font/plane01/plane01-combining.txt.
00046
00047 26 December 2017 [Paul Hardy]:
00048 - Remove Miao hard-coding; they are back in unibmp2hex.c and
00049 in font/plane01/plane01-combining.txt.
00050
00051 11 May 2019 [Paul Hardy]:
00052 - Changed strncpy calls to memcpy calls to avoid a compiler
00053 warning.

## 5.31 src/unigenwidth.c File Reference

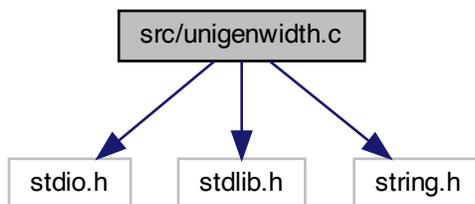

unigenwidth - IEEE 1003.1-2008 setup to calculate wchar\_t string widths

```
#include <stdio.h>
```

```
#include <stdlib.h>
```

```
#include <string.h>
```

Include dependency graph for unigenwidth.c:

### Macros

- #define `MAXSTRING` 256  
Maximum input line length - 1.
- #define `PIKTO_START` 0x0F0E70  
Start of Pikto code point range.
- #define `PIKTO_END` 0x0F11EF  
End of Pikto code point range.
- #define `PIKTO_SIZE` (`PIKTO_END` - `PIKTO_START` + 1)

### Functions

- int `main` (int argc, char \*\*argv)  
The main function.

#### 5.31.1 Detailed Description

unigenwidth - IEEE 1003.1-2008 setup to calculate wchar\_t string widths

Author

Paul Hardy.

## Copyright

Copyright (C) 2013, 2017 Paul Hardy.

All glyphs are treated as 16 pixels high, and can be 8, 16, 24, or 32 pixels wide (resulting in widths of 1, 2, 3, or 4, respectively).

Definition in file [unigenwidth.c](#).

## 5.31.2 Macro Definition Documentation

### 5.31.2.1 MAXSTRING

```
#define MAXSTRING 256
```

Maximum input line length - 1.

Definition at line [46](#) of file [unigenwidth.c](#).

### 5.31.2.2 PIKTO\_END

```
#define PIKTO_END 0x0F11EF
```

End of Pikto code point range.

Definition at line [50](#) of file [unigenwidth.c](#).

### 5.31.2.3 PIKTO\_SIZE

```
#define PIKTO_SIZE (PIKTO_END - PIKTO_START + 1)
```

Number of code points in Pikto range.

Definition at line [52](#) of file [unigenwidth.c](#).

### 5.31.2.4 PIKTO\_START

```
#define PIKTO_START 0x0F0E70
```

Start of Pikto code point range.

Definition at line [49](#) of file [unigenwidth.c](#).

## 5.31.3 Function Documentation

### 5.31.3.1 main()

```
int main (  
    int argc,  
    char ** argv )
```

The main function.

## Parameters

in	argc	The count of command line arguments.
in	argv	Pointer to array of command line arguments.

## Returns

This program exits with status `EXIT_SUCCESS`.

Definition at line 63 of file `unigenwidth.c`.

00175 Let glyph widths represent 0xFFFC (object replacement character)
00176 and 0xFFFFD (replacement character).
00177 */
00178
00179 /*
00180 Hangul Jamo:
00181
00182 Leading Consonant (Choseong): leave spacing as is.
00183
00184 Hangul Choseong Filler (U+115F): set width to 2.
00185
00186 Hangul Jungseong Filler, Hangul Vowel (Jungseong), and
00187 Final Consonant (Jongseong): set width to 0, because these
00188 combine with the leading consonant as one composite syllabic
00189 glyph. As of Unicode 5.2, the Hangul Jamo block (U+1100..U+11FF)
00190 is completely filled.

```

```

00191 */
00192 // for (i = 0x1160; i <= 0x11FF; i++) glyph_width[i]=0; /* Vowels & Final Consonants */
00193
00194 /*
00195 Private Use Area -- the width is undefined, but likely
00196 to be 2 charcells wide either from a graphic glyph or
00197 from a four-digit hexadecimal glyph representing the
00198 code point. Therefore if any PUA glyph does not have
00199 a non-zero width yet, assign it a default width of 2.
00200 The Unicode Standard allows giving PUA characters
00201 default property values; see for example The Unicode
00202 Standard Version 5.0, p. 91. This same default is
00203 used for higher plane PUA code points below.
00204 */

## 5.33 src/unihangul-support.c File Reference

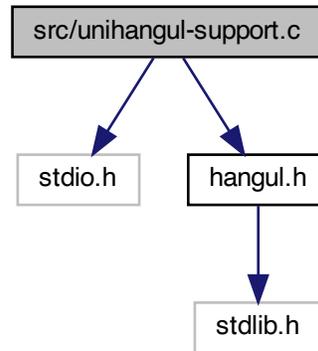

Functions for converting Hangul letters into syllables.

```

#include <stdio.h>
#include "hangul.h"

```

Include dependency graph for unihangul-support.c:

## Functions

- unsigned [hangul\\_read\\_base8](#) (FILE \*infp, unsigned char base[][32])  
Read hangul-base.hex file into a unsigned char array.
- unsigned [hangul\\_read\\_base16](#) (FILE \*infp, unsigned base[][16])  
Read hangul-base.hex file into a unsigned array.
- void [hangul\\_decompose](#) (unsigned codept, int \*initial, int \*medial, int \*final)  
Decompose a Hangul Syllables code point into three letters.
- unsigned [hangul\\_compose](#) (int initial, int medial, int final)  
Compose a Hangul syllable into a code point, or 0 if none exists.
- void [hangul\\_hex\\_indices](#) (int choseong, int jungseong, int jongseong, int \*cho\_index, int \*jung\_index, int \*jong\_index)  
Determine index values to the bitmaps for a syllable's components.
- void [hangul\\_variations](#) (int choseong, int jungseong, int jongseong, int \*cho\_var, int \*jung\_var, int \*jong\_var)  
Determine the variations of each letter in a Hangul syllable.
- int [cho\\_variation](#) (int choseong, int jungseong, int jongseong)  
Return the Johab 6/3/1 choseong variation for a syllable.
- int [is\\_wide\\_vowel](#) (int vowel)  
Whether vowel has rightmost vertical stroke to the right.
- int [jung\\_variation](#) (int choseong, int jungseong, int jongseong)  
Return the Johab 6/3/1 jungseong variation.
- int [jong\\_variation](#) (int choseong, int jungseong, int jongseong)  
Return the Johab 6/3/1 jongseong variation.
- void [hangul\\_syllable](#) (int choseong, int jungseong, int jongseong, unsigned char hangul\_base[][32], unsigned char \*syllable)  
Given letters in a Hangul syllable, return a glyph.
- int [glyph\\_overlap](#) (unsigned \*glyph1, unsigned \*glyph2)  
See if two glyphs overlap.

- void `combine_glyphs` (unsigned \*glyph1, unsigned \*glyph2, unsigned \*combined\_glyph)  
Combine two glyphs into one glyph.
- void `print_glyph_txt` (FILE \*fp, unsigned codept, unsigned \*this\_glyph)  
Print one glyph in Unifont hexdraw plain text style.
- void `print_glyph_hex` (FILE \*fp, unsigned codept, unsigned \*this\_glyph)  
Print one glyph in Unifont hexdraw hexadecimal string style.
- void `one_jamo` (unsigned glyph\_table[MAX\_GLYPHS][16], unsigned jamo, unsigned \*jamo\_glyph)  
Convert Hangul Jamo choseong, jungseong, and jongseong into a glyph.
- void `combined_jamo` (unsigned glyph\_table[MAX\_GLYPHS][16], unsigned cho, unsigned jung, unsigned jong, unsigned \*combined\_glyph)  
Convert Hangul Jamo choseong, jungseong, and jongseong into a glyph.

### 5.33.1 Detailed Description

Functions for converting Hangul letters into syllables.

This file contains functions for reading in Hangul letters arranged in a Johab 6/3/1 pattern and composing syllables with them. One function maps an initial letter (choseong), medial letter (jungseong), and final letter (jongseong) into the Hangul Syllables Unicode block, U+AC00..U+D7A3. Other functions allow formation of glyphs that include the ancient Hangul letters that Hanterm supported. More can be added if desired, with appropriate changes to start positions and lengths defined in "hangul.h".

### 5.33.2 Function Documentation

#### 5.33.2.1 cho\_variation()

```
int cho_variation (
    int choseong,
    int jungseong,
    int jongseong )
```

Return the Johab 6/3/1 choseong variation for a syllable.

This function takes the two or three (if jongseong is included) letters that comprise a syllable and determine the variation of the initial consonant (choseong).

Each choseong has 6 variations:

#### Variation Occurrence

0 Choseong with a vertical vowel such as "A". 1 Choseong with a horizontal vowel such as "O". 2 Choseong with a vertical and horizontal vowel such as "WA". 3 Same as variation 0, but with jongseong (final consonant). 4 Same as variation 1, but with jongseong (final consonant). Also a horizontal vowel pointing down, such as U and YU. 5 Same as variation 2, but with jongseong (final consonant). Also a horizontal vowel pointing down with vertical element, such as WEO, WE, and WI.

In addition, if the vowel is horizontal and a downward-pointing stroke as in the modern letters U, WEO, WE, WI, and YU, and in archaic letters YU-YEO, YU-YE, YU-I, araea, and araea-i, then 3 is added to the initial variation of 0 to 2, resulting in a choseong variation of 3 to 5, respectively.

## Parameters

in	choseong	The 1st letter in the syllable.
in	jungseong	The 2nd letter in the syllable.
in	jongseong	The 3rd letter in the syllable.

## Returns

The choseong variation, 0 to 5.

```

void combine_glyphs (
    unsigned * glyph1,

```

```

    unsigned * glyph2,
    unsigned * combined_glyph )

```

Combine two glyphs into one glyph.

Parameters

in	glyph1	The first glyph to overlap.
in	glyph2	The second glyph to overlap.
out	combined_glyph	The returned combination glyph.

Definition at line 637 of file [unihangul-support.c](#).

```

### 5.33.2.3 combined\_jamo()

```

void combined_jamo (
    unsigned glyph_table[MAX_GLYPHS][16],
    unsigned cho,
    unsigned jung,

```

```

    unsigned jong,
    unsigned * combined_glyph )

```

Convert Hangul Jamo choseong, jungseong, and jongseong into a glyph.

This function converts input Hangul choseong, jungseong, and jongseong Unicode code triplets into a Hangul syllable. Any of those with an out of range code point are assigned a blank glyph for combining. This function performs the following steps:

- 1) Determine the sequence number of choseong, jungseong, and jongseong, from 0 to the total number of choseong, jungseong, or jongseong, respectively, minus one. The sequence for each is as follows:
  - a) Choseong: Unicode code points of U+1100..U+115E and then U+A960..U+A97C.
  - b) Jungseong: Unicode code points of U+1161..U+11A7 and then U+D7B0..U+D7C6.
  - c) Jongseong: Unicode code points of U+11A8..U+11FF and then U+D7CB..U+D7FB.
- 2) From the choseong, jungseong, and jongseong sequence number, determine the variation of choseong and jungseong (there is only one jongseong variation, although it is shifted right by one column for some vowels with a pair of long vertical strokes on the right side).
- 3) Convert the variation numbers for the three syllable components to index locations in the glyph array.
- 4) Combine the glyph array glyphs into a syllable.

#### Parameters

in	glyph_table	The collection of all jamo glyphs.
in	cho	The choseong Unicode code point, 0 or 0x1100..0x115F.
in	jung	The jungseong Unicode code point, 0 or 0x1160..0x11A7.

## Parameters

in	jong	The jongseong Unicode code point, 0 or 0x11A8..0x11FF.
out	combined_glyph	The output glyph, 16 columns in each of 16 rows.

## 5.33.2.4 glyph\_overlap()

```
int glyph_overlap (
    unsigned * glyph1,
    unsigned * glyph2 )
```

See if two glyphs overlap.

## Parameters

in	glyph1	The first glyph, as a 16-row bitmap.
in	glyph2	The second glyph, as a 16-row bitmap.

## Returns

0 if no overlaps between glyphs, 1 otherwise.

Definition at line 613 of file unihangul-support.c.

```
00613     {
00614     int overlaps; /* Return value; 0 if no overlaps, -1 if overlaps. */
00615     int i;
00616
00617     /* Check for overlaps between the two glyphs. */
00618
00619     i = 0;
00620     do {
00621         overlaps = (glyph1[i] & glyph2[i]) != 0;
00622         i++;
00623     } while (i < 16 && overlaps == 0);
00624
00625     return overlaps;
00626 }
```

## 5.33.2.5 hangul\_compose()

```
unsigned hangul_compose (
    int initial,
    int medial,
    int final )
```

Compose a Hangul syllable into a code point, or 0 if none exists.

This function takes three letters that can form a modern Hangul syllable and returns the corresponding Unicode Hangul Syllables code point in the range 0xAC00 to 0xD7A3.

If a three-letter combination includes one or more archaic letters, it will not map into the Hangul Syllables range. In that case, the returned code point will be 0 to indicate that no valid Hangul Syllables code point exists.

## Parameters

in	initial	The first letter (choseong), 0 to 18.
in	medial	The second letter (jungseong), 0 to 20.
in	final	The third letter (jongseong), 0 to 26 or -1 if none.

## Returns

The Unicode Hangul Syllables code point, 0xAC00 to 0xD7A3.

Definition at line 201 of file `unihangul-support.c`.

```

00201     {
00202     unsigned codept;
00203
00204
00205     if (initial >= 0 && initial <= 18 &&
00206         medial >= 0 && medial <= 20 &&
00207         final >= 0 && final <= 26) {
00208
00209         codept = 0xAC00;
00210         codept += initial * 21 * 28;
00211         codept += medial * 28;
00212         codept += final + 1;
00213     }
00214     else {
00215         codept = 0;
00216     }
00217
00218     return codept;
00219 }
```

5.33.2.6 `hangul_decompose()`

```

void hangul_decompose (
    unsigned codept,
    int * initial,
    int * medial,
    int * final )
```

Decompose a Hangul Syllables code point into three letters.

Decompose a Hangul Syllables code point (U+AC00..U+D7A3) into:

- Choseong 0-19

- Jungseong 0-20
- Jongseong 0-27 or -1 if no jongseong

All letter values are set to -1 if the letters do not form a syllable in the Hangul Syllables range. This function only handles modern Hangul, because that is all that is in the Hangul Syllables range.

Parameters

in	codept	The Unicode code point to decode, from 0xAC00 to 0xD7A3.
out	initial	The 1st letter (choseong) in the syllable.
out	initial	The 2nd letter (jungseong) in the syllable.
out	initial	The 3rd letter (jongseong) in the syllable.

Definition at line 167 of file [unihangul-support.c](#).

```

00167 {
00168
00169     if (codept < 0xAC00 || codept > 0xD7A3) {
00170         *initial = *medial = *final = -1;
00171     }
00172     else {
00173         codept -= 0xAC00;
00174         *initial = codept / (28 * 21);
00175         *medial = (codept / 28) % 21;
00176         *final = codept % 28 - 1;
00177     }
00178
00179     return;
00180 }

```

### 5.33.2.7 hangul\_hex\_indices()

```

void hangul_hex_indices (
    int choseong,
    int jungseong,
    int jongseong,
    int * cho_index,
    int * jung_index,
    int * jong_index )
  
```

Determine index values to the bitmaps for a syllable's components.

This function reads these input values for modern and ancient Hangul letters:

- Choseong number (0 to the number of modern and archaic choseong - 1).
- Jungseong number (0 to the number of modern and archaic jungseong - 1).
- Jongseong number (0 to the number of modern and archaic jongseong - 1, or -1 if none).

It then determines the variation of each letter given the combination with the other two letters (or just choseong and jungseong if the jongseong value is -1).

These variations are then converted into index locations within the glyph array that was read in from the hangul-base.hex file. Those index locations can then be used to form a composite syllable.

There is no restriction to only use the modern Hangul letters.

#### Parameters

in	choseong	The 1st letter in the syllable.
in	jungseong	The 2nd letter in the syllable.

## Parameters

in	jongseong	The 3rd letter in the syllable, or -1 if none.
out	cho_index	Index location to the 1st letter variation from the hangul-base.hex file.
out	jung_index	Index location to the 2nd letter variation from the hangul-base.hex file.
out	jong_index	Index location to the 3rd letter variation from the hangul-base.hex file.

Definition at line 249 of file unihangul-support.c.

### 5.33.2.8 hangul\_read\_base16()

```

unsigned hangul_read_base16 (
    FILE * infp,
    unsigned base[][16] )

```

Read hangul-base.hex file into a unsigned array.

Read a Hangul base .hex file with separate choseong, jungseong, and jongseong glyphs for syllable formation. The order is:

- Empty glyph in 0x0000 position.
- Initial consonants (choseong).
- Medial vowels and diphthongs (jungseong).

- Final consonants (jongseong).
- Individual letter forms in isolation, not for syllable formation.

The letters are arranged with all variations for one letter before continuing to the next letter. In the current encoding, there are 6 variations of choseong, 3 of jungseong, and 1 of jongseong per letter.

#### Parameters

in	Input	file pointer; can be stdin.
out	Array	of bit patterns, with 16 16-bit values per letter.

#### Returns

The maximum code point value read in the file.

Definition at line 116 of file [unihangul-support.c](#).

```

00116         {
00117     unsigned codept;

### 5.33.2.10 hangul\_syllable()

```

void hangul_syllable (
    int choseong,
    int jungseong,
    int jongseong,
    unsigned char hangul_base[][32],
    unsigned char * syllable )

```

Given letters in a Hangul syllable, return a glyph.

This function returns a glyph bitmap comprising up to three Hangul letters that form a syllable. It reads the three component letters (choseong, jungseong, and jongseong), then calls a function that determines the appropriate variation of each letter, returning the letter bitmap locations in the glyph array. Then these letter bitmaps are combined with a logical OR operation to produce a final bitmap, which forms a 16 row by 16 column bitmap glyph.

## Parameters

in	choseong	The 1st letter in the composite glyph.
in	jungseong	The 2nd letter in the composite glyph.
in	jongseong	The 3rd letter in the composite glyph.
in	hangul_base	The glyphs read from the "hangul_base.hex" file.

## Returns

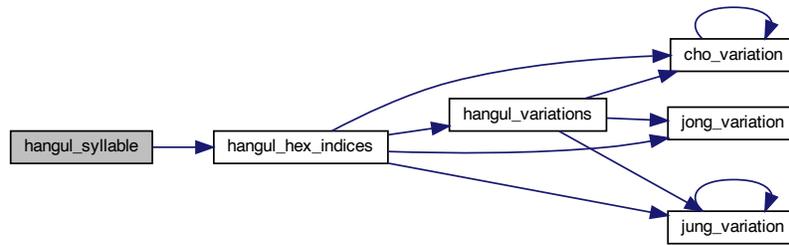

syllable The composite syllable, as a 16 by 16 pixel bitmap.

Definition at line 583 of file [unihangul-support.c](#).

```

00584                                     {
00585
00586     int    i; /* loop variable */

#### 5.33.2.11 hangul\_variations()

```

void hangul_variations (
    int choseong,
    int jungseong,
    int jongseong,
    int * cho_var,
    int * jung_var,
    int * jong_var )
  
```

Determine the variations of each letter in a Hangul syllable.

Given the three letters that will form a syllable, return the variation of each letter used to form the composite glyph.

This function can determine variations for both modern and archaic Hangul letters; it is not limited to only the letters combinations that comprise the Unicode Hangul Syllables range.

This function reads these input values for modern and ancient Hangul letters:

- Choseong number (0 to the number of modern and archaic choseong - 1).
- Jungseong number (0 to the number of modern and archaic jungseong - 1).
- Jongseong number (0 to the number of modern and archaic jongseong - 1, or -1 if none).

It then determines the variation of each letter given the combination with the other two letters (or just choseong and jungseong if the jongseong value is -1).

## Parameters

in	choseong	The 1st letter in the syllable.
in	jungseong	The 2nd letter in the syllable.
in	jongseong	The 3rd letter in the syllable, or -1 if none.
out	cho_var	Variation of the 1st letter from the hangul-base.hex file.
out	jung_var	Variation of the 2nd letter from the hangul-base.hex file.
out	jong_var	Variation of the 3rd letter from the hangul-base.hex file.

### 5.33.2.13 jong\_variation()

```

int jong_variation (
    int choseong,
    int jungseong,
    int jongseong ) [inline]

```

Return the Johab 6/3/1 jongseong variation.

There is only one jongseong variation, so this function always returns 0. It is a placeholder function for possible future adaptation to other johab encodings.

Parameters

in	choseong	The 1st letter in the syllable.
in	jungseong	The 2nd letter in the syllable.
in	jongseong	The 3rd letter in the syllable.

## Returns

The jongseong variation, always 0.

Definition at line 558 of file [unihangul-support.c](#).

```
00558     {
00559
00560     return 0; /* There is only one Jongseong variation. */
00561 }
```

Here is the caller graph for this function:

## 5.33.2.14 jung\_variation()

```
int jung_variation (
    int choseong,
    int jungseong,
    int jongseong ) [inline]
```

Return the Johab 6/3/1 jungseong variation.

This function takes the two or three (if jongseong is included) letters that comprise a syllable and determine the variation of the vowel (jungseong).

Each jungseong has 3 variations:

Variation Occurrence

0 Jungseong with only chungseong (no jungseong). 1 Jungseong with chungseong and jungseong (except nieun). 2 Jungseong with chungseong and jungseong nieun.

## Parameters

in	choseong	The 1st letter in the syllable.
in	jungseong	The 2nd letter in the syllable.
in	jongseong	The 3rd letter in the syllable.

## Returns

The jungseong variation, 0 to 2.

Definition at line 524 of file [unihangul-support.c](#).

```

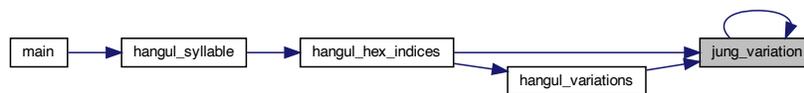

00524     {
00525     int jung_variation; /* Return value */
00526

## 5.33.2.15 one\_jamo()

```

void one_jamo (
    unsigned glyph_table[MAX_GLYPHS][16],
    unsigned jamo,
    unsigned * jamo_glyph )

```

Convert Hangul Jamo choseong, jungseong, and jongseong into a glyph.

## Parameters

in	glyph_table	The collection of all jamo glyphs.
in	jamo	The Unicode code point, 0 or 0x1100..0x115F.
out	jamo_glyph	The output glyph, 16 columns in each of 16 rows.

Definition at line 717 of file [unihangul-support.c](#).

00740     }
00741
00742     return;
00743 }

```

### 5.33.2.16 print\_glyph\_hex()

```

void print_glyph_hex (
    FILE * fp,
    unsigned codept,
    unsigned * this_glyph )

```

Print one glyph in Unifont hexdraw hexadecimal string style.

## Parameters

in	fp	The file pointer for output.
in	codept	The Unicode code point to print with the glyph.
in	this_glyph	The 16-row by 16-column glyph to print.

Definition at line 692 of file [unihangul-support.c](#).

00001 /**
00002 @file unihangul-support.c
00003
00004 @brief Functions for converting Hangul letters into syllables
00005
00006 This file contains functions for reading in Hangul letters
00007 arranged in a Johab 6/3/1 pattern and composing syllables
00008 with them. One function maps an initial letter (choseong),
00009 medial letter (jungseong), and final letter (jongseong)
00010 into the Hangul Syllables Unicode block, U+AC00..U+D7A3.
00011 Other functions allow formation of glyphs that include
00012 the ancient Hangul letters that Hanterm supported. More
00013 can be added if desired, with appropriate changes to
00014 start positions and lengths defined in "hangul.h".

00222 /**
00223 @brief Determine index values to the bitmaps for a syllable's components.
00224
00225 This function reads these input values for modern and ancient Hangul letters:
00226
00227 - Choseong number (0 to the number of modern and archaic choseong - 1.
00228 - Jungseong number (0 to the number of modern and archaic jungseong - 1.
00229 - Jongseong number (0 to the number of modern and archaic jongseong - 1, or -1 if none.
00230
00231 It then determines the variation of each letter given the combination with
00232 the other two letters (or just choseong and jungseong if the jongseong value
00233 is -1).
00234
00235 These variations are then converted into index locations within the
00236 glyph array that was read in from the hangul-base.hex file. Those
00237 index locations can then be used to form a composite syllable.
00238
00239 There is no restriction to only use the modern Hangul letters.

```

```

00240
00241 @param[in] choseong The 1st letter in the syllable.
00242 @param[in] jungseong The 2nd letter in the syllable.
00243 @param[in] jongseong The 3rd letter in the syllable, or -1 if none.
00244 @param[out] cho_index Index location to the 1st letter variation from the hangul-base.hex file.
00245 @param[out] jung_index Index location to the 2nd letter variation from the hangul-base.hex file.
00246 @param[out] jong_index Index location to the 3rd letter variation from the hangul-base.hex file.

00318 @brief Return the Johab 6/3/1 choseong variation for a syllable.
00319
00320 This function takes the two or three (if jongseong is included)

```

```

00321 letters that comprise a syllable and determine the variation
00322 of the initial consonant (choseong).
00323
00324 Each choseong has 6 variations:
00325
00326 Variation  Occurrence
00327 -----  -----
00328 0      Choseong with a vertical vowel such as "A".
00329 1      Choseong with a horizontal vowel such as "O".
00330 2      Choseong with a vertical and horizontal vowel such as "WA".
00331 3      Same as variation 0, but with jongseong (final consonant).
00332 4      Same as variation 1, but with jongseong (final consonant).
00333 Also a horizontal vowel pointing down, such as U and YU.
00334 5      Same as variation 2, but with jongseong (final consonant).
00335 Also a horizontal vowel pointing down with vertical element,
00336 such as WEO, WE, and WI.
00337
00338 In addition, if the vowel is horizontal and a downward-pointing stroke
00339 as in the modern letters U, WEO, WE, WI, and YU, and in archaic
00340 letters YU-YEO, YU-YE, YU-I, araea, and araea-i, then 3 is added
00341 to the initial variation of 0 to 2, resulting in a choseong variation
00342 of 3 to 5, respectively.
00343
00344 @param[in] choseong The 1st letter in the syllable.
00345 @param[in] jungseong The 2nd letter in the syllable.
00346 @param[in] jongseong The 3rd letter in the syllable.
00347 @return The choseong variation, 0 to 5.

00747 @brief Convert Hangul Jamo choseong, jungseong, and jongseong into a glyph.
00748
00749 This function converts input Hangul choseong, jungseong, and jongseong
00750 Unicode code triplets into a Hangul syllable. Any of those with an
00751 out of range code point are assigned a blank glyph for combining.
00752
00753 This function performs the following steps:
00754
00755 1) Determine the sequence number of choseong, jungseong,
00756 and jongseong, from 0 to the total number of choseong,
00757 jungseong, or jongseong, respectively, minus one. The
00758 sequence for each is as follows:
00759
00760 a) Choseong: Unicode code points of U+1100..U+115E
00761 and then U+A960..U+A97C.
00762
00763 b) Jungseong: Unicode code points of U+1161..U+11A7
00764 and then U+D7B0..U+D7C6.
00765

00767 and then U+D7CB..U+D7FB.
00768
00769 2) From the choseong, jungseong, and jongseong sequence number,
00770 determine the variation of choseong and jungseong (there is
00771 only one jongseong variation, although it is shifted right
00772 by one column for some vowels with a pair of long vertical
00773 strokes on the right side).
00774
00775 3) Convert the variation numbers for the three syllable
00776 components to index locations in the glyph array.
00777
00778 4) Combine the glyph array glyphs into a syllable.
00779
00780 @param[in] glyph_table The collection of all jamo glyphs.

## 5.35 src/unihex2bmp.c File Reference

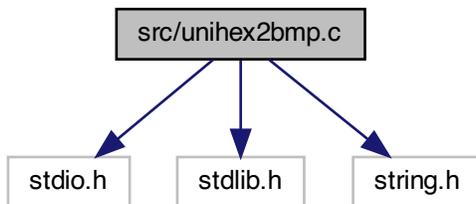

unihex2bmp - Turn a GNU Unifont hex glyph page of 256 code points into a bitmap for editing

```

#include <stdio.h>
#include <stdlib.h>
#include <string.h>

```

Include dependency graph for unihex2bmp.c:

## Macros

- `#define` [MAXBUF](#) 256

## Functions

- `int` [main](#) (`int` argc, `char` \*argv[])  
The main function.
- `int` [hex2bit](#) (`char` \*instring, `unsigned char` character[32][4])  
Generate a bitmap for one glyph.
- `int` [init](#) (`unsigned char` bitmap[17 \*32][18 \*4])  
Initialize the bitmap grid.

## Variables

- `char` \* [hex](#) [18]  
GNU Unifont bitmaps for hexadecimal digits.
- `unsigned char` [hexbits](#) [18][32]  
The digits converted into bitmaps.
- `unsigned` [unipage](#) =0  
Unicode page number, 0x00..0xff.
- `int` [flip](#) =1  
Transpose entire matrix as in Unicode book.

### 5.35.1 Detailed Description

`unihex2bmp` - Turn a GNU Unifont hex glyph page of 256 code points into a bitmap for editing

#### Author

Paul Hardy, unifoundry <at> unifoundry.com, December 2007

## Copyright

Copyright (C) 2007, 2008, 2013, 2017 Paul Hardy

This program reads in a GNU Unifont .hex file, extracts a range of 256 code points, and converts it a Microsoft Bitmap (.bmp) or Wireless Bitmap file.

Synopsis: unihex2bmp [-iin\_file.hex] [-oout\_file.bmp] [-f] [-phex\_page\_num] [-w]

Definition in file [unihex2bmp.c](#).

## 5.35.2 Macro Definition Documentation

### 5.35.2.1 MAXBUF

```
#define MAXBUF 256
```

Definition at line 50 of file [unihex2bmp.c](#).

## 5.35.3 Function Documentation

### 5.35.3.1 hex2bit()

```
int hex2bit (
    char * instring,
    unsigned char character[32][4] )
```

Generate a bitmap for one glyph.

Convert the portion of a hex string after the ':' into a character bitmap.

If string is  $\geq 128$  characters, it will fill all 4 bytes per row. If string is  $\geq 64$  characters and  $< 128$ , it will fill 2 bytes per row. Otherwise, it will fill 1 byte per row.

#### Parameters

in	instring	The character array containing the glyph bitmap.
out	character	<a href="#">Glyph</a> bitmap, 8, 16, or 32 columns by 16 rows tall.

## Returns

Always returns 0.

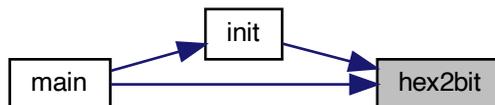

Definition at line 367 of file [unihex2bmp.c](#).

```

00368 {
00369
00370 int i; /* current row in bitmap character */
00371 int j; /* current character in input string */

### 5.35.3.2 init()

```
int init (
    unsigned char bitmap[17 * 32][18 * 4] )
```

Initialize the bitmap grid.

## Parameters

out	bitmap	The bitmap to generate, with 32x32 pixel glyph areas.
-----	--------	---

## Returns

Always returns 0.

## 5.35.4 Variable Documentation

### 5.35.4.1 flip

```
int flip =1
```

Transpose entire matrix as in Unicode book.

Definition at line 88 of file [unihex2bmp.c](#).

### 5.35.4.2 hex

```
char* hex[18]
```

Initial value:

```
= {

}
```

GNU Unifont bitmaps for hexadecimal digits.

These are the GNU Unifont hex strings for '0'-'9' and 'A'-'F', for encoding as bit strings in row and column headers.

Looking at the final bitmap as a grid of 32\*32 bit tiles, the first row contains a hexadecimal character string of the first 3 hex digits in a 4 digit Unicode character name; the top column contains a hex character string of the 4th (low-order) hex digit of the Unicode character.

Definition at line 65 of file [unihex2bmp.c](#).

### 5.35.4.3 hexbits

```
unsigned char hexbits[18][32]
```

The digits converted into bitmaps.

Definition at line 85 of file [unihex2bmp.c](#).

#### 5.35.4.4 unipage

unsigned unipage =0

Unicode page number, 0x00..0xff.

Definition at line 87 of file [unihex2bmp.c](#).

## 5.36 unihex2bmp.c

[Go to the documentation of this file.](#)

unihexgen - Generate a series of glyphs containing hexadecimal code points

```

#include <stdio.h>
#include <stdlib.h>

```

Include dependency graph for `unihexgen.c`:

## Functions

- int `main` (int argc, char \*argv[])  
The main function.
- void `hexprint4` (int thiscp)  
Generate a bitmap containing a 4-digit Unicode code point.
- void `hexprint6` (int thiscp)  
Generate a bitmap containing a 6-digit Unicode code point.

## Variables

- char `hexdigit` [16][5]  
Bitmap pattern for each hexadecimal digit.

### 5.37.1 Detailed Description

`unihexgen` - Generate a series of glyphs containing hexadecimal code points

Author

Paul Hardy

Copyright

Copyright (C) 2013 Paul Hardy

This program generates glyphs in Unifont `.hex` format that contain four- or six-digit hexadecimal numbers in a 16x16 pixel area. These are rendered as white digits on a black background. `argv[1]` is the starting code point (as a hexadecimal string, with no leading "0x"). `argv[2]` is the ending code point (as a hexadecimal string, with no leading "0x").

For example:

```
unihexgen e000 f8ff > pua.hex
```

This generates the Private Use Area glyph file.

This utility program works in Roman Czyborra's `unifont.hex` file format, the basis of the GNU Unifont package.

Definition in file [unihexgen.c](#).

## 5.37.2 Function Documentation

### 5.37.2.1 hexprint4()

```
void hexprint4 (
    int thiscp )
```

Generate a bitmap containing a 4-digit Unicode code point.

Takes a 4-digit Unicode code point as an argument and prints a unifont.hex string for it to stdout.

Parameters

in	thiscp	The current code point for which to generate a glyph.
----	--------	---

Definition at line 160 of file [unihexgen.c](#).

```
00161 {
00162
00163     int grid[16]; /* the glyph grid we'll build */
00164
00165     int row;      /* row number in current glyph */
00166     int digitrow; /* row number in current hex digit being rendered */
00167     int rowbits; /* 1 & 0 bits to draw current glyph row */
00168
00169     int d1, d2, d3, d4; /* four hexadecimal digits of each code point */
00170
00171     d1 = (thiscp » 12) & 0xF;
00172     d2 = (thiscp » 8) & 0xF;
00173     d3 = (thiscp » 4) & 0xF;
00174     d4 = (thiscp    ) & 0xF;
00175
00176     /* top and bottom rows are white */
00177     grid[0] = grid[15] = 0x0000;
00178
00179     /* 14 inner rows are 14-pixel wide black lines, centered */
00180     for (row = 1; row < 15; row++) grid[row] = 0x7FFE;
00181
00182     printf ("%04X:", thiscp);
00183
00184     /*
00185     Render the first row of 2 hexadecimal digits
00186     */
00187     digitrow = 0; /* start at top of first row of digits to render */
00188     for (row = 2; row < 7; row++) {
00189         rowbits = (hexdigit[d1][digitrow] « 9) |
00190                 (hexdigit[d2][digitrow] « 3);
00191         grid[row] ^= rowbits; /* digits appear as white on black background */
00192         digitrow++;
00193     }
00194
00195     /*
00196     Render the second row of 2 hexadecimal digits
00197     */

00200         rowbits = (hexdigit[d3][digitrow] « 9) |
00201                 (hexdigit[d4][digitrow] « 3);
00202         grid[row] ^= rowbits; /* digits appear as white on black background */
00203         digitrow++;
```

```

00204 }
00205
00206 for (row = 0; row < 16; row++) printf ("%04X", grid[row] & 0xFFFF);
00207
00208 putchar ('\n');
00209
00210 return;
00211 }

```

Here is the caller graph for this function:

### 5.37.2.2 hexprint6()

```

void hexprint6 (
    int thiscp )

```

Generate a bitmap containing a 6-digit Unicode code point.

Takes a 6-digit Unicode code point as an argument and prints a unifont.hex string for it to stdout.

#### Parameters

in	thiscp	The current code point for which to generate a glyph.

Definition at line [223](#) of file [unihexgen.c](#).

```

00145         }
00146     }
00147     exit (EXIT_SUCCESS);
00148 }

```

Here is the call graph for this function:

### 5.37.3 Variable Documentation

#### 5.37.3.1 hexdigit

```
char hexdigit[16][5]
```

Initial value:

```

= {
  {0x6,0x9,0x9,0x9,0x6},
  {0x2,0x6,0x2,0x2,0x7},
  {0xF,0x1,0xF,0x8,0xF},
  {0xE,0x1,0x7,0x1,0xE},
  {0x9,0x9,0xF,0x1,0x1},
  {0xF,0x8,0xF,0x1,0xF},
  {0x6,0x8,0xE,0x9,0x6},
  {0xF,0x1,0x2,0x4,0x4},
  {0x6,0x9,0x6,0x9,0x6},
  {0x6,0x9,0x7,0x1,0x6},
  {0xF,0x9,0xF,0x9,0x9},
  {0xE,0x9,0xE,0x9,0xE},
  {0x7,0x8,0x8,0x8,0x7},
  {0xE,0x9,0x9,0x9,0xE},
  {0xF,0x8,0xE,0x8,0xF},
  {0xF,0x8,0xE,0x8,0x8}
}

```

Bitmap pattern for each hexadecimal digit.

hexdigit[][] definition: the bitmap pattern for each hexadecimal digit.

Each digit is drawn as a 4 wide by 5 high bitmap, so each digit row is one hexadecimal digit, and each entry has 5 rows.

For example, the entry for digit 1 is:

```
{0x2,0x6,0x2,0x2,0x7},
```

which corresponds graphically to:

```

-#- ==> 0010 ==> 0x2 -##- ==> 0110 ==> 0x6 -#- ==> 0010 ==> 0x2 -#- ==> 0010 ==> 0x2
-### ==> 0111 ==> 0x7

```

These row values will then be exclusive-ORed with four one bits (binary 1111, or 0xF) to form white digits on a black background.

Functions hexprint4 and hexprint6 share the hexdigit array; they print four-digit and six-digit hexadecimal code points in a single glyph, respectively.

Definition at line 84 of file [unihexgen.c](#).

## 5.39 unihexpose.c

```

00001 /**
00002 @file: unihetranspose.c
00003
00004 @brief: Transpose Unifont glyph bitmaps.
00005
00006 This program takes Unifont .hex format glyphs and converts those
00007 glyphs so that each byte (two hexadecimal digits in the .hex file)
00008 represents a column of 8 rows. This simplifies use with graphics
00009 display controllers that write lines consisting of 8 rows at a time
00010 to a display.
00011
00012 The bytes are ordered as first all the columns for the glyph in
00013 the first 8 rows, then all the columns in the next 8 rows, with
00014 columns ordered from left to right.
00015
00016 This file must be linked with functions in unifont-support.c.

## Macros

- `#define MAXFILENAME 1024`
- `#define START_JUNG 0`  
Vowel index of first vowel with which to begin.
- `#define RED 0xCC0000`  
Color code for slightly unsaturated HTML red.
- `#define GREEN 0x00CC00`  
Color code for slightly unsaturated HTML green.
- `#define BLUE 0x0000CC`  
Color code for slightly unsaturated HTML blue.
- `#define BLACK 0x000000`  
Color code for HTML black.
- `#define WHITE 0xFFFFFFFF`  
Color code for HTML white.

## Functions

- `int main (int argc, char *argv[])`  
The main function.
- `void parse_args (int argc, char *argv[], int *inindex, int *outindex, int *modern_only)`  
Parse command line arguments.

### 5.40.1 Detailed Description

Display overlapped Hangul letter combinations in a grid.

This displays overlapped letters that form Unicode Hangul Syllables combinations, as a tool to determine bounding boxes for all combinations. It works with both modern and archaic Hangul letters.

Input is a Unifont .hex file such as the "hangul-base.hex" file that is part of the Unifont package. Glyphs are all processed as being 16 pixels wide and 16 pixels tall.

Output is an HTML file containing 16 by 16 pixel grids showing overlaps in table format, arranged by variation of the initial consonant (choseong).

Initial consonants (choseong) have 6 variations. In general, the first three are for combining with vowels (jungseong) that are vertical, horizontal, or vertical and horizontal, respectively; the second set of three variations are for combinations with a final consonant.

The output HTML file can be viewed in a web browser.

## 5.40.2 Macro Definition Documentation

### 5.40.2.1 BLACK

```
#define BLACK 0x000000
```

Color code for HTML black.

Definition at line [62](#) of file [unijohab2html.c](#).

### 5.40.2.2 BLUE

```
#define BLUE 0x0000CC
```

Color code for slightly unsaturated HTML blue.

Definition at line [61](#) of file [unijohab2html.c](#).

### 5.40.2.3 GREEN

```
#define GREEN 0x00CC00
```

Color code for slightly unsaturated HTML green.

Definition at line [60](#) of file [unijohab2html.c](#).

### 5.40.2.4 MAXFILENAME

```
#define MAXFILENAME 1024
```

Definition at line [52](#) of file [unijohab2html.c](#).

### 5.40.2.5 RED

```
#define RED 0xCC0000
```

Color code for slightly unsaturated HTML red.

Definition at line [59](#) of file [unijohab2html.c](#).

### 5.40.2.6 START\_JUNG

```
#define START_JUNG 0
```

Vowel index of first vowel with which to begin.

Definition at line 54 of file [unijohab2html.c](#).

### 5.40.2.7 WHITE

```
#define WHITE 0xFFFFFFFF
```

Color code for HTML white.

Definition at line 63 of file [unijohab2html.c](#).

## 5.40.3.2 parse\_args()

```
void parse_args (
    int argc,
    char * argv[],
    int * inindex,
    int * outindex,
    int * modern_only )
```

Parse command line arguments.

## Parameters

in	argc	The argc parameter to the main function.
in	argv	The argv command line arguments to the main function.
in,out	infile	The input file-name; defaults to NULL.
in,out	outfile	The output file-name; defaults to NULL.

## 5.41 unijohab2html.c

[Go to the documentation of this file.](#)

```

00001 /**
00002 @file unijohab2html.c
00003
00004 @brief Display overlapped Hangul letter combinations in a grid.
00005
00006 This displays overlapped letters that form Unicode Hangul Syllables
00007 combinations, as a tool to determine bounding boxes for all combinations.
00008 It works with both modern and archaic Hangul letters.
00009
00010 Input is a Unifont .hex file such as the "hangul-base.hex" file that
00011 is part of the Unifont package. Glyphs are all processed as being
00012 16 pixels wide and 16 pixels tall.
00013
00014 Output is an HTML file containing 16 by 16 pixel grids showing
00015 overlaps in table format, arranged by variation of the initial
00016 consonant (choseong).
00017
00018 Initial consonants (choseong) have 6 variations. In general, the
00019 first three are for combining with vowels (jungseong) that are
00020 vertical, horizontal, or vertical and horizontal, respectively;
00021 the second set of three variations are for combinations with a final
00022 consonant.
00023
00024 The output HTML file can be viewed in a web browser.

## 5.42 src/unipagecount.c File Reference

unipagecount - Count the number of glyphs defined in each page of 256 code points

```
#include <stdio.h>
```

```
#include <stdlib.h>
```

Include dependency graph for unipagecount.c:

## Macros

- `#define MAXBUF 256`  
Maximum input line size - 1.

## Functions

- `int main (int argc, char *argv[])`  
The main function.
- `void mkftable (unsigned plane, int pagecount[256], int links)`  
Create an HTML table linked to PNG images.

### 5.42.1 Detailed Description

unipagecount - Count the number of glyphs defined in each page of 256 code points

Author

Paul Hardy, unifoundry <at> unifoundry.com, December 2007

Copyright

Copyright (C) 2007, 2008, 2013, 2014 Paul Hardy

This program counts the number of glyphs that are defined in each "page" of 256 code points, and prints the counts in an 8 x 8 grid. Input is from stdin. Output is to stdout.

The background color of each cell in a 16-by-16 grid of 256 code points is shaded to indicate percentage coverage. Red indicates 0% coverage, green represents 100% coverage, and colors in between pure red and pure green indicate partial coverage on a scale.

Each code point range number can be a hyperlink to a PNG file for that 256-code point range's corresponding bitmap glyph image.

Synopsis:

```

unipagecount < font_file.hex > count.txt
unipagecount -phex_page_num < font_file.hex -- just 256 points
unipagecount -h < font_file.hex -- HTML table
unipagecount -P1 -h < font.hex > count.html -- Plane 1, HTML out
unipagecount -l < font_file.hex -- linked HTML table
  
```

## 5.42.2 Macro Definition Documentation

### 5.42.2.1 MAXBUF

```
#define MAXBUF 256
```

Maximum input line size - 1.

Definition at line 59 of file [unipagecount.c](#).

## 5.42.3 Function Documentation

### 5.42.3.1 main()

```
int main (
    int argc,
    char * argv[] )
```

The main function.

Parameters

in	argc	The count of command line arguments.
in	argv	Pointer to array of command line arguments.

Returns

This program exits with status 0.

Definition at line 70 of file [unipagecount.c](#).

Here is the call graph for this function:

### 5.42.3.2 mkftable()

```
void mkftable (
    unsigned plane,
    int pagecount[256],
    int links )
```

Create an HTML table linked to PNG images.

This function creates an HTML table to show PNG files in a 16 by 16 grid. The background color of each "page" of 256 code points is shaded from red (for 0% coverage) to green (for 100% coverage).

#### Parameters

in	plane	The Uni-code plane, 0..17.
in	pagecount	Array with count of glyphs in each 256 code point range.

## Parameters

in	links	1 = generate hyperlinks, 0 = do not generate hyperlinks.

```

00001 /**
00002  @file unipagecount.c
00003
00004  @brief unipagecount - Count the number of glyphs defined in each page
00005  of 256 code points
00006
00007  @author Paul Hardy, unifoundry <at> unifoundry.com, December 2007
00008
00009  @copyright Copyright (C) 2007, 2008, 2013, 2014 Paul Hardy
00010
00011  This program counts the number of glyphs that are defined in each
00012  "page" of 256 code points, and prints the counts in an 8 x 8 grid.
00013  Input is from stdin. Output is to stdout.
00014
00015  The background color of each cell in a 16-by-16 grid of 256 code points
00016  is shaded to indicate percentage coverage. Red indicates 0% coverage,
00017  green represents 100% coverage, and colors in between pure red and pure
00018  green indicate partial coverage on a scale.
00019
00020  Each code point range number can be a hyperlink to a PNG file for
00021  that 256-code point range's corresponding bitmap glyph image.
00022
00023  Synopsis:
00024
00025  unipagecount < font_file.hex > count.txt
00026  unipagecount -phex_page_num < font_file.hex -- just 256 points
00027  unipagecount -h < font_file.hex -- HTML table
00028  unipagecount -P1 -h < font_file.hex > count.html -- Plane 1, HTML out
00029  unipagecount -l < font_file.hex -- linked HTML table
